SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336170 target RNA into GAM336170 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336170 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336170 target genes. The mRNA of each one of this plurality of GAM336170 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336170 RNA, herein designated GAM RNA, and which when bound by GAM336170 RNA causes inhibition of translation of the GAM336170 target mRNA into a corresponding GAM336170 target protein.

The mechanism of the translational inhibition exerted by GAM336170 RNA, herein designated GAM RNA, on one or more GAM336170 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336170 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336170 RNA, herein designated GAM RNA, of GAM336170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336170 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336170 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336170 RNA correlate with, and may be deduced from, the identity of the GAM336170 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336171 6521 GCTACTCAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGCTGAGGC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGAGGATCA Messenger 336171 (GAM336171) oligonucleotides modulates expression of respective target
CTTGAGCCTG genes whose function and utility is known in the art.

GGAGGTCTAG GAM336171 is a novel bioinformatically detectable regulatory, non protein
GCTGCAGTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336171 was detected
GCCGGGACGA is described with additional reference to Figs. 9-15.

TGCCACTGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTCCAGCCTG encoded by the human genome.

GGCAACAGAG GAM336171 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TGAGACCCTG GAM336171 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TCCCAGCACT GAM336171 precursor RNA does not encode a protein. A nucleotide sequence identical or

CTGGGAGGC highly similar to the nucleotide sequence of GAM336171 precursor RNA is designated SEQ
ID:6521, and is provided hereinbelow with reference to the sequence listing part.

GAM336171 precursor RNA folds onto itself, forming GAM336171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336171 precursor RNA, designated SEQ ID NO: 6521, and a schematic representation of a predicted secondary folding of GAM336171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336171 folded precursor RNA yielding a GAM336171 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336171 RNA, hereby incorporated herein. Expression of GAM336171 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336171 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336171 target RNA, herein designated GAM TARGET RNA.

GAM336171 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336171 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336171 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336171 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336171 RNA, herein designated GAM RNA, to target binding sites on GAM336171 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336171 target RNA into GAM336171 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336171 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336171 target genes. The mRNA of each one of this plurality of GAM336171 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336171 RNA, herein designated GAM RNA, and which when bound by GAM336171 RNA causes inhibition of translation of the GAM336171 target mRNA into a corresponding GAM336171 target protein.

The mechanism of the translational inhibition exerted by GAM336171 RNA, herein designated GAM RNA, on one or more GAM336171 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336171 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336171 RNA, herein designated GAM RNA, of GAM336171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336171 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336171 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336171 RNA correlate with, and may be deduced from, the identity of the GAM336171 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336172 6534 GCTCGAACCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAAGGTGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTTGCAGTG Messenger 336172 (GAM336172) oligonucleotides modulates expression of respective target

AGCCGAGATC genes whose function and utility is known in the art.

GTGCCACTGC GAM336172 is a novel bioinformatically detectable regulatory, non protein

ACTCCAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336172 was detected

GGGCAACACA is described with additional reference to Figs. 9-15.

GC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336172 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336172 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336172 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336172 precursor RNA is designated SEQ ID:6534, and is provided hereinbelow with reference to the sequence listing part.

GAM336172 precursor RNA folds onto itself, forming GAM336172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336172 precursor RNA, designated SEQ ID NO: 6534, and a schematic representation of a predicted secondary folding of GAM336172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336172 folded precursor RNA yielding a GAM336172 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336172 RNA, hereby incorporated herein. Expression of GAM336172 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336172 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336172 target RNA, herein designated GAM TARGET RNA.

GAM336172 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336172 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336172 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336172 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336172 RNA, herein designated GAM RNA, to target

binding sites on GAM336172 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336172 target RNA into GAM336172 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336172 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336172 target genes. The mRNA of each one of this plurality of GAM336172 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336172 RNA, herein designated GAM RNA, and which when bound by GAM336172 RNA causes inhibition of translation of the GAM336172 target mRNA into a corresponding GAM336172 target protein.

The mechanism of the translational inhibition exerted by GAM336172 RNA, herein designated GAM RNA, on one or more GAM336172 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336172 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336172 RNA, herein designated GAM RNA, of GAM336172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336172 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336172 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336172 RNA correlate with, and may be deduced from, the identity of the GAM336172 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336175 RNA, herein designated GAM RNA, to target binding sites on GAM336175 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336175 target RNA into GAM336175 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336175 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336175 target genes. The mRNA of each one of this plurality of GAM336175 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336175 RNA, herein designated GAM RNA, and which when bound by GAM336175 RNA causes inhibition of translation of the GAM336175 target mRNA into a corresponding GAM336175 target protein.

The mechanism of the translational inhibition exerted by GAM336175 RNA, herein designated GAM RNA, on one or more GAM336175 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336175 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336175 RNA, herein designated GAM RNA, of GAM336175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336175 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336175 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336175 RNA correlate with, and may be deduced from, the identity of the GAM336175 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336176 6585 GGAATGTTCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GAAGAACTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGATCTTGT Messenger 336176 (GAM336176) oligonucleotides modulates expression of respective target
GAAATCTGTG genes whose function and utility is known in the art.

GACCCTACAT GAM336176 is a novel bioinformatically detectable regulatory, non protein
TGGCACTTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336176 was detected
TGTGTACCTA is described with additional reference to Figs. 9-15.

AGGGCTAACG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCCCAAATAA encoded by the human genome.

AGTCATTCAG GAM336176 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TGCTTTGCAG GAM336176 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
AAACAGGTC GAM336176 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336176 precursor RNA is designated SEQ ID:6585, and is provided hereinbelow with reference to the sequence listing part.

GAM336176 precursor RNA folds onto itself, forming GAM336176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336176 precursor RNA, designated SEQ ID NO: 6585, and a schematic representation of a predicted secondary folding of GAM336176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336176 folded precursor RNA yielding a GAM336176 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336176 RNA, hereby incorporated herein. Expression of GAM336176 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336176 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336176 target RNA, herein designated GAM TARGET RNA.

GAM336176 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336176 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336176 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336176 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336176 RNA, herein designated GAM RNA, to target binding sites on GAM336176 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336176 target RNA into GAM336176 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336176 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336176 target genes. The mRNA of each one of this plurality of GAM336176 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336176 RNA, herein designated GAM RNA, and which when bound by GAM336176 RNA causes inhibition of translation of the GAM336176 target mRNA into a corresponding GAM336176 target protein.

The mechanism of the translational inhibition exerted by GAM336176 RNA, herein designated GAM RNA, on one or more GAM336176 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336176 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336176 RNA, herein designated GAM RNA, of GAM336176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336176 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336176 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336176 RNA correlate with, and may be deduced from, the identity of the GAM336176 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336177 6588 GGACCAGACT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTGTGACAT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAGAATGTA Messenger 336177 (GAM336177) oligonucleotides modulates expression of respective target

GAGAAATTAT genes whose function and utility is known in the art.

TCAATGTTCA GAM336177 is a novel bioinformatically detectable regulatory, non protein

GGATCAACAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336177 was detected

GATCTCCTCA is described with additional reference to Figs. 9-15.

CTCTAGGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GATCC encoded by the human genome.

GAM336177 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336177 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336177 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336177 precursor RNA is designated SEQ ID:6588, and is provided hereinbelow with reference to the sequence listing part.

GAM336177 precursor RNA folds onto itself, forming GAM336177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336177 precursor RNA, designated SEQ ID NO: 6588, and a schematic representation of a predicted secondary folding of GAM336177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336177 folded precursor RNA yielding a GAM336177 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336177 RNA, hereby incorporated herein. Expression of GAM336177 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336177 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336177 target RNA, herein designated GAM TARGET RNA.

GAM336177 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336177 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336177 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336177 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336177 RNA, herein designated GAM RNA, to target binding sites on GAM336177 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336177 target RNA into GAM336177 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336177 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336177 target genes. The mRNA of each one of this plurality of GAM336177 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336177 RNA, herein designated GAM RNA, and which when bound by GAM336177 RNA causes inhibition of translation of the GAM336177 target mRNA into a corresponding GAM336177 target protein.

The mechanism of the translational inhibition exerted by GAM336177 RNA, herein designated GAM RNA, on one or more GAM336177 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336177 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336177 RNA, herein designated GAM RNA, of GAM336177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336177 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336177 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336177 RNA correlate with, and may be deduced from, the identity of the GAM336177 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

The mechanism of the translational inhibition exerted by GAM336180 RNA, herein designated GAM RNA, on one or more GAM336180 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336180 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336180 RNA, herein designated GAM RNA, of GAM336180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336180 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336180 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336180 RNA correlate with, and may be deduced from, the identity of the GAM336180 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336181 6626 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAGTGGAGG Messenger 336181 (GAM336181) oligonucleotides modulates expression of respective target
TTGCAGGGAG genes whose function and utility is known in the art.

CCATGATCGC GAM336181 is a novel bioinformatically detectable regulatory, non protein
ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336181 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGACTCC encoded by the human genome.

GAM336181 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336181 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336181 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336181 precursor RNA is designated SEQ ID:6626, and is provided hereinbelow with reference to the sequence listing part.

GAM336181 precursor RNA folds onto itself, forming GAM336181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336181 precursor RNA, designated SEQ ID NO: 6626, and a schematic representation of a predicted secondary folding of GAM336181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336181 folded precursor RNA yielding a GAM336181 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336181 RNA, hereby incorporated herein. Expression of GAM336181 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336181 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336181 target RNA, herein designated GAM TARGET RNA.

GAM336181 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336181 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336181 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336181 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336181 RNA, herein designated GAM RNA, to target binding sites on GAM336181 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336181 target RNA into GAM336181 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336181 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336181 target genes. The mRNA of each one of this plurality of GAM336181 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336181 RNA, herein designated GAM RNA, and which when bound by GAM336181 RNA causes inhibition of translation of the GAM336181 target mRNA into a corresponding GAM336181 target protein.

The mechanism of the translational inhibition exerted by GAM336181 RNA, herein designated GAM RNA, on one or more GAM336181 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336181 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336181 RNA, herein designated GAM RNA, of GAM336181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336181 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336181 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336181

RNA correlate with, and may be deduced from, the identity of the GAM336181 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336182 (GAM336182) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336182 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336182 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336182 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336182 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336182 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336182 precursor RNA is designated SEQ ID:6628, and is provided hereinbelow with reference to the sequence listing part.

GAM336182 precursor RNA folds onto itself, forming GAM336182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336182 precursor RNA, designated SEQ ID NO: 6628, and a schematic representation of a predicted secondary folding of GAM336182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336182 folded precursor RNA yielding a GAM336182 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336182 RNA, hereby incorporated herein. Expression of GAM336182 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336182 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336182 target RNA, herein designated GAM TARGET RNA.

GAM336182 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336182 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336182 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336182 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336182 RNA, herein designated GAM RNA, to target binding sites on GAM336182 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336182 target RNA into GAM336182 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336182 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336182 target genes. The mRNA of each one of this plurality of GAM336182 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336182 RNA, herein designated GAM RNA, and which when bound by GAM336182 RNA causes inhibition of translation of the GAM336182 target mRNA into a corresponding GAM336182 target protein.

The mechanism of the translational inhibition exerted by GAM336182 RNA, herein designated GAM RNA, on one or more GAM336182 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336182 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336182 RNA, herein designated GAM RNA, of GAM336182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336182 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336182 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336182 RNA correlate with, and may be deduced from, the identity of the GAM336182 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Nucleotide sequences of a `diced` GAM336185 RNA, herein designated GAM RNA, of GAM336185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336185 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336185 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336185 RNA correlate with, and may be deduced from, the identity of the GAM336185 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336186 6663 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACTCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGGGAGGC Messenger 336186 (GAM336186) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACA GAM336186 is a novel bioinformatically detectable regulatory, non protein

CACCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336186 was detected

CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGACCC encoded by the human genome.

GAM336186 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336186 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336186 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336186 precursor RNA is designated SEQ ID:6663, and is provided hereinbelow with reference to the sequence listing part.

GAM336186 precursor RNA folds onto itself, forming GAM336186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336186 precursor RNA, designated SEQ ID NO: 6663, and a schematic representation of a predicted secondary folding of GAM336186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336186 folded precursor RNA yielding a GAM336186 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336186 RNA, hereby incorporated herein. Expression of GAM336186 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336186 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336186 target RNA, herein designated GAM TARGET RNA.

GAM336186 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336186 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336186 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336186 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336186 RNA, herein designated GAM RNA, to target

binding sites on GAM336186 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336186 target RNA into GAM336186 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336186 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336186 target genes. The mRNA of each one of this plurality of GAM336186 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336186 RNA, herein designated GAM RNA, and which when bound by GAM336186 RNA causes inhibition of translation of the GAM336186 target mRNA into a corresponding GAM336186 target protein.

The mechanism of the translational inhibition exerted by GAM336186 RNA, herein designated GAM RNA, on one or more GAM336186 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336186 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336186 RNA, herein designated GAM RNA, of GAM336186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336186 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336186 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336186 RNA correlate with, and may be deduced from, the identity of the GAM336186 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336187 6670 GGAGAATGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGAACCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGC Messenger 336187 (GAM336187) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCCAGATTGC GAM336187 is a novel bioinformatically detectable regulatory, non protein

AACACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336187 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGACTCT encoded by the human genome.

GAM336187 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336187 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336187 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336187 precursor RNA is designated SEQ ID:6670, and is provided hereinbelow with reference to the sequence listing part.

GAM336187 precursor RNA folds onto itself, forming GAM336187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336187 precursor RNA, designated SEQ ID NO: 6670, and a schematic representation of a predicted secondary folding of GAM336187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336187 folded precursor RNA yielding a GAM336187 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336187 RNA, hereby incorporated herein. Expression of GAM336187 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336187 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336187 target RNA, herein designated GAM TARGET RNA.

GAM336187 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336187 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336187 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336187 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336187 RNA, herein designated GAM RNA, to target binding sites on GAM336187 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336187 target RNA into GAM336187 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336187 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336187 target genes. The mRNA of each one of this plurality of GAM336187 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336187 RNA, herein designated GAM RNA, and which when bound by GAM336187 RNA causes inhibition of translation of the GAM336187 target mRNA into a corresponding GAM336187 target protein.

The mechanism of the translational inhibition exerted by GAM336187 RNA, herein designated GAM RNA, on one or more GAM336187 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336187 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336187 RNA, herein designated GAM RNA, of GAM336187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336187 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336187 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336187 RNA correlate with, and may be deduced from, the identity of the GAM336187 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336188 6671 GGAGAATGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGC Messenger 336188 (GAM336188) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM336188 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336188 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGACTCC encoded by the human genome.

GAM336188 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336188 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336188 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336188 precursor RNA is designated SEQ ID:6671, and is provided hereinbelow with reference to the sequence listing part.

GAM336188 precursor RNA folds onto itself, forming GAM336188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

GAM336191 6683 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCAGAAG Messenger 336191 (GAM336191) oligonucleotides modulates expression of respective target

CTGCAGTGAG genes whose function and utility is known in the art.

CCAAGATAGT GAM336191 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336191 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM336191 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336191 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336191 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336191 precursor RNA is designated SEQ ID:6683, and is provided hereinbelow with reference to the sequence listing part.

GAM336191 precursor RNA folds onto itself, forming GAM336191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336191 precursor RNA, designated SEQ ID NO: 6683, and

a schematic representation of a predicted secondary folding of GAM336191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336191 folded precursor RNA yielding a GAM336191 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336191 RNA, hereby incorporated herein. Expression of GAM336191 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336191 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336191 target RNA, herein designated GAM TARGET RNA.

GAM336191 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336191 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336191 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336191 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336191 RNA, herein designated GAM RNA, to target binding sites on GAM336191 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336191 target RNA into GAM336191 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336191 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336191 target genes. The mRNA of each one of this plurality of GAM336191 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336191 RNA, herein designated GAM RNA, and which when bound by GAM336191 RNA causes inhibition of translation of the GAM336191 target mRNA into a corresponding GAM336191 target protein.

The mechanism of the translational inhibition exerted by GAM336191 RNA, herein designated GAM RNA, on one or more GAM336191 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336191 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336191 RNA, herein designated GAM RNA, of GAM336191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336191 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336191 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336191 RNA correlate with, and may be deduced from, the identity of the GAM336191 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336192 6685 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 336192 (GAM336192) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATTGA GAM336192 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336192 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAAACTCC encoded by the human genome.

GAM336192 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336192 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336192 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336192 precursor RNA is designated SEQ ID:6685, and is provided hereinbelow with reference to the sequence listing part.

GAM336192 precursor RNA folds onto itself, forming GAM336192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336192 precursor RNA, designated SEQ ID NO: 6685, and a schematic representation of a predicted secondary folding of GAM336192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336192 folded precursor RNA yielding a GAM336192 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336192 RNA, hereby incorporated herein. Expression of GAM336192 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336192 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336192 target RNA, herein designated GAM TARGET RNA.

GAM336192 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336192 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336192 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336192 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336192 RNA, herein designated GAM RNA, to target binding sites on GAM336192 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336192 target RNA into GAM336192 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336192 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336192 target genes. The mRNA of each one of this plurality of GAM336192 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336192 RNA,

herein designated GAM RNA, and which when bound by GAM336192 RNA causes inhibition of translation of the GAM336192 target mRNA into a corresponding GAM336192 target protein.

The mechanism of the translational inhibition exerted by GAM336192 RNA, herein designated GAM RNA, on one or more GAM336192 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336192 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336192 RNA, herein designated GAM RNA, of GAM336192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336192 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336192 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336192 RNA correlate with, and may be deduced from, the identity of the GAM336192 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336193 6686 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 336193 (GAM336193) oligonucleotides modulates expression of respective target

TTTCAGTGAG genes whose function and utility is known in the art.

CCAAGATTGT GAM336193 is a novel bioinformatically detectable regulatory, non protein

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336193 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM336193 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336193 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336193 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336193 precursor RNA is designated SEQ ID:6686, and is provided hereinbelow with reference to the sequence listing part.

GAM336193 precursor RNA folds onto itself, forming GAM336193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336193 precursor RNA, designated SEQ ID NO: 6686, and a schematic representation of a predicted secondary folding of GAM336193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336193 folded precursor RNA yielding a GAM336193 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336193 RNA, hereby incorporated herein. Expression of GAM336193 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336193 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336193 target RNA, herein designated GAM TARGET RNA.

GAM336193 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336193 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336193 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336193 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336193 RNA, herein designated GAM RNA, to target binding sites on GAM336193 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336193 target RNA

into GAM336193 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336193 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336193 target genes. The mRNA of each one of this plurality of GAM336193 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336193 RNA, herein designated GAM RNA, and which when bound by GAM336193 RNA causes inhibition of translation of the GAM336193 target mRNA into a corresponding GAM336193 target protein.

The mechanism of the translational inhibition exerted by GAM336193 RNA, herein designated GAM RNA, on one or more GAM336193 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336193 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336193 RNA, herein designated GAM RNA, of GAM336193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336193 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336193 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336193 RNA correlate with, and may be deduced from, the identity of the GAM336193 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336194 6691 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCAGAGG Messenger 336194 (GAM336194) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGT GAM336194 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336194 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM336194 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336194 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336194 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336194 precursor RNA is designated SEQ ID:6691, and is provided hereinbelow with reference to the sequence listing part.

GAM336194 precursor RNA folds onto itself, forming GAM336194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336194 precursor RNA, designated SEQ ID NO: 6691, and a schematic representation of a predicted secondary folding of GAM336194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336194 folded precursor RNA yielding a GAM336194 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336194 RNA, hereby incorporated herein. AAAACTCC encoded by the human genome.

GAM336196 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336196 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336196 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336196 precursor RNA is designated SEQ ID:6696, and is provided hereinbelow with reference to the sequence listing part.

GAM336196 precursor RNA folds onto itself, forming GAM336196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336196 precursor RNA, designated SEQ ID NO: 6696, and a schematic representation of a predicted secondary folding of GAM336196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336196 folded precursor RNA yielding a GAM336196 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336196 RNA, hereby incorporated herein. Expression of GAM336196 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336196 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336196 target RNA, herein designated GAM TARGET RNA.

GAM336196 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336196 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336196 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336196 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336196 RNA, herein designated GAM RNA, to target binding sites on GAM336196 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336196 target RNA into GAM336196 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336196 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336196 target genes. The mRNA of each one of this plurality of GAM336196 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336196 RNA, herein designated GAM RNA, and which when bound by GAM336196 RNA causes inhibition of translation of the GAM336196 target mRNA into a corresponding GAM336196 target protein.

The mechanism of the translational inhibition exerted by GAM336196 RNA, herein designated GAM RNA, on one or more GAM336196 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336196 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336196 RNA, herein designated GAM RNA, of GAM336196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336196 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336196 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336196 RNA correlate with, and may be deduced from, the identity of the GAM336196 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336197 6711 GGAGGATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGATGGAGG Messenger 336197 (GAM336197) oligonucleotides modulates expression of respective target
TCTCAGTGAG genes whose function and utility is known in the art.

CTGAGATTGC GAM336197 is a novel bioinformatically detectable regulatory, non protein
GTCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336197 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336197 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336197 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336197 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336197 precursor RNA is designated SEQ ID:6711, and is provided hereinbelow with reference to the sequence listing part.

GAM336197 precursor RNA folds onto itself, forming GAM336197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336197 precursor RNA, designated SEQ ID NO: 6711, and a schematic representation of a predicted secondary folding of GAM336197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336197 folded precursor RNA yielding a GAM336197 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336197 RNA, hereby incorporated herein. Expression of GAM336197 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336197 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336197 target RNA, herein designated GAM TARGET RNA.

GAM336197 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336197 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336197 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336197 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336197 RNA, herein designated GAM RNA, to target binding sites on GAM336197 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336197 target RNA into GAM336197 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336197 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336197 target genes. The mRNA of each one of this plurality of GAM336197 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336197 RNA, herein designated GAM RNA, and which when bound by GAM336197 RNA causes inhibition of translation of the GAM336197 target mRNA into a corresponding GAM336197 target protein.

The mechanism of the translational inhibition exerted by GAM336197 RNA, herein designated GAM RNA, on one or more GAM336197 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336197 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336197 RNA, herein designated GAM RNA, of GAM336197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336197 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336197 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336197 RNA correlate with, and may be deduced from, the identity of the GAM336197 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336198 6712 GGAGGCTGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGTGAGACT encoded by the human genome.

CTGTC GAM336201 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336201 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336201 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336201 precursor RNA is designated SEQ ID:6734, and is provided hereinbelow with reference to the sequence listing part.

GAM336201 precursor RNA folds onto itself, forming GAM336201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336201 precursor RNA, designated SEQ ID NO: 6734, and a schematic representation of a predicted secondary folding of GAM336201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336201 folded precursor RNA yielding a GAM336201 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336201 RNA, hereby incorporated herein. Expression of GAM336201 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336201 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336201 target RNA, herein designated GAM TARGET RNA.

GAM336201 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336201 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336201 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336201 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336201 RNA, herein designated GAM RNA, to target binding sites on GAM336201 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336201 target RNA into GAM336201 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336201 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336201 target genes. The mRNA of each one of this plurality of GAM336201 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336201 RNA, herein designated GAM RNA, and which when bound by GAM336201 RNA causes inhibition of translation of the GAM336201 target mRNA into a corresponding GAM336201 target protein.

The mechanism of the translational inhibition exerted by GAM336201 RNA, herein designated GAM RNA, on one or more GAM336201 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336201 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336201 RNA, herein designated GAM RNA, of GAM336201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336201 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336201 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336201 RNA correlate with, and may be deduced from, the identity of the GAM336201 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336202 6736 GGCAGGAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCTTGAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGGGAGGTG Messenger 336202 (GAM336202) oligonucleotides modulates expression of respective target

GAGGTTGCAG genes whose function and utility is known in the art.

TGAGCCGAGA GAM336202 is a novel bioinformatically detectable regulatory, non protein
TCGCACCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336202 was detected
GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGTGAGGCT encoded by the human genome.

CTGTC GAM336202 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336202 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336202 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336202 precursor RNA is designated SEQ ID:6736, and is provided hereinbelow with reference to the sequence listing part.

GAM336202 precursor RNA folds onto itself, forming GAM336202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336202 precursor RNA, designated SEQ ID NO: 6736, and a schematic representation of a predicted secondary folding of GAM336202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336202 folded precursor RNA yielding a GAM336202 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336202 RNA, hereby incorporated herein. Expression of GAM336202 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336202 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336202 target RNA, herein designated GAM TARGET RNA.

GAM336202 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336202 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336202 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336202 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336202 RNA, herein designated GAM RNA, to target binding sites on GAM336202 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336202 target RNA into GAM336202 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336202 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336202 target genes. The mRNA of each one of this plurality of GAM336202 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336202 RNA, herein designated GAM RNA, and which when bound by GAM336202 RNA causes inhibition of translation of the GAM336202 target mRNA into a corresponding GAM336202 target protein.

The mechanism of the translational inhibition exerted by GAM336202 RNA, herein designated GAM RNA, on one or more GAM336202 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336202 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336202 RNA, herein designated GAM RNA, of GAM336202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336202 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336202 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336202 RNA correlate with, and may be deduced from, the identity of the GAM336202 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336203 6810 GGGGATGTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336206 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGCAAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336206 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336206 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336206 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336206 precursor RNA is designated SEQ ID:6998, and is provided hereinbelow with reference to the sequence listing part.

GAM336206 precursor RNA folds onto itself, forming GAM336206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336206 precursor RNA, designated SEQ ID NO: 6998, and a schematic representation of a predicted secondary folding of GAM336206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336206 folded precursor RNA yielding a GAM336206 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336206 RNA, hereby incorporated herein. Expression of GAM336206 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336206 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336206 target RNA, herein designated GAM TARGET RNA.

GAM336206 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336206 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336206 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336206 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336206 RNA, herein designated GAM RNA, to target binding sites on GAM336206 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336206 target RNA into GAM336206 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336206 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336206 target genes. The mRNA of each one of this plurality of GAM336206 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336206 RNA,

herein designated GAM RNA, and which when bound by GAM336206 RNA causes inhibition of translation of the GAM336206 target mRNA into a corresponding GAM336206 target protein.

The mechanism of the translational inhibition exerted by GAM336206 RNA, herein designated GAM RNA, on one or more GAM336206 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336206 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336206 RNA, herein designated GAM RNA, of GAM336206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336206 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336206 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336206 RNA correlate with, and may be deduced from, the identity of the GAM336206 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336207 7003 TCACTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTGGAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 336207 (GAM336207) oligonucleotides modulates expression of respective target

TGAGCCGATA genes whose function and utility is known in the art.

TCATGCCACT GAM336207 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336207 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

CAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336207 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336207 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336207 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336207 precursor RNA is designated SEQ ID:7003, and is provided hereinbelow with reference to the sequence listing part.

GAM336207 precursor RNA folds onto itself, forming GAM336207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336207 precursor RNA, designated SEQ ID NO: 7003, and a schematic representation of a predicted secondary folding of GAM336207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336207 folded precursor RNA yielding a GAM336207 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336207 RNA, hereby incorporated herein. Expression of GAM336207 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336207 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336207 target RNA, herein designated GAM TARGET RNA.

GAM336207 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336207 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336207 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336207 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336207 RNA, herein designated GAM RNA, to target binding sites on GAM336207 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336207 target RNA

into GAM336207 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336207 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336207 target genes. The mRNA of each one of this plurality of GAM336207 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336207 RNA, herein designated GAM RNA, and which when bound by GAM336207 RNA causes inhibition of translation of the GAM336207 target mRNA into a corresponding GAM336207 target protein.

The mechanism of the translational inhibition exerted by GAM336207 RNA, herein designated GAM RNA, on one or more GAM336207 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336207 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336207 RNA, herein designated GAM RNA, of GAM336207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336207 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336207 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336207 RNA correlate with, and may be deduced from, the identity of the GAM336207 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336208 7023 TCCATTGCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGCTGACCT detected oligonucleotides of the present invention, referred to here as Genomic Address

TATCGTCACT Messenger 336208 (GAM336208) oligonucleotides modulates expression of respective target

ACGCCAGAGA genes whose function and utility is known in the art.

AGTGGGATGG GAM336208 is a novel bioinformatically detectable regulatory, non protein

AGTCAGCAGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336208 was detected

AGCTGGCAAA is described with additional reference to Figs. 9-15.

ATAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336208 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336208 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336208 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336208 precursor RNA is designated SEQ ID:7023, and is provided hereinbelow with reference to the sequence listing part.

GAM336208 precursor RNA folds onto itself, forming GAM336208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336208 precursor RNA, designated SEQ ID NO: 7023, and a schematic representation of a predicted secondary folding of GAM336208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336208 folded precursor RNA yielding a GAM336208 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336208 RNA, hereby incorporated herein. Expression of GAM336208 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336208 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336208 target RNA, herein designated GAM TARGET RNA.

GAM336208 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336208 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336208 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336208 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336208 RNA, herein designated GAM RNA, to target binding sites on GAM336208 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336208 target RNA into GAM336208 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336208 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336208 target genes. The mRNA of each one of this plurality of GAM336208 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336208 RNA, herein designated GAM RNA, and which when bound by GAM336208 RNA causes inhibition of translation of the GAM336208 target mRNA into a corresponding GAM336208 target protein.

The mechanism of the translational inhibition exerted by GAM336208 RNA, herein designated GAM RNA, on one or more GAM336208 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336208 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336208 RNA, herein designated GAM RNA, of GAM336208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336208 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336208 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336208 RNA correlate with, and may be deduced from, the identity of the GAM336208 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336209 7051 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCGGAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGATTGCAG Messenger 336209 (GAM336209) oligonucleotides modulates expression of respective target

TGAGCCGAGA genes whose function and utility is known in the art.

TCATGCCACT GAM336209 is a novel bioinformatically detectable regulatory, non protein
GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336209 was detected
CTGGGCAACA is described with additional reference to Figs. 9-15.

AGAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336209 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336209 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336209 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336209 precursor RNA is designated SEQ ID:7051, and is provided hereinbelow with reference to the sequence listing part.

GAM336209 precursor RNA folds onto itself, forming GAM336209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

ACATAGCAAC encoded by the human genome.

ACTCTGTCTC GAM336211 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM336211 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336211 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336211 precursor RNA is designated SEQ ID:7100, and is provided hereinbelow with reference to the sequence listing part.

GAM336211 precursor RNA folds onto itself, forming GAM336211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336211 precursor RNA, designated SEQ ID NO: 7100, and a schematic representation of a predicted secondary folding of GAM336211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336211 folded precursor RNA yielding a GAM336211 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336211 RNA, hereby incorporated herein. Expression of GAM336211 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336211 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336211 target RNA, herein designated GAM TARGET RNA.

GAM336211 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336211 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336211 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336211 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336211 RNA, herein designated GAM RNA, to target binding sites on GAM336211 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336211 target RNA into GAM336211 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336211 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336211 target genes. The mRNA of each one of this plurality of GAM336211 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336211 RNA, herein designated GAM RNA, and which when bound by GAM336211 RNA causes inhibition of translation of the GAM336211 target mRNA into a corresponding GAM336211 target protein.

The mechanism of the translational inhibition exerted by GAM336211 RNA, herein designated GAM RNA, on one or more GAM336211 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336211 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336211 RNA, herein designated GAM RNA, of GAM336211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336211 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336211 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336211 RNA correlate with, and may be deduced from, the identity of the GAM336211 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336212 7101 TGAGACAGTA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCACTTGAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAGGGGGTG Messenger 336212 (GAM336212) oligonucleotides modulates expression of respective target

GAGGTTGCGG genes whose function and utility is known in the art.

TGAGCCGAGA GAM336212 is a novel bioinformatically detectable regulatory, non protein

TTGTGCCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336212 was detected

GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGTGAGACT encoded by the human genome.

CTGTTTCA GAM336212 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336212 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336212 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336212 precursor RNA is designated SEQ ID:7101, and is provided hereinbelow with reference to the sequence listing part.

GAM336212 precursor RNA folds onto itself, forming GAM336212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336212 precursor RNA, designated SEQ ID NO: 7101, and a schematic representation of a predicted secondary folding of GAM336212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336212 folded precursor RNA yielding a GAM336212 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336212 RNA, hereby incorporated herein. Expression of GAM336212 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336212 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336212 target RNA, herein designated GAM TARGET RNA.

GAM336212 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336212 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336212 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336212 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336212 RNA, herein designated GAM RNA, to target binding sites on GAM336212 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336212 target RNA into GAM336212 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336212 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336212 target genes. The mRNA of each one of this plurality of GAM336212 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336212 RNA, herein designated GAM RNA, and which when bound by GAM336212 RNA causes inhibition of translation of the GAM336212 target mRNA into a corresponding GAM336212 target protein.

The mechanism of the translational inhibition exerted by GAM336212 RNA, herein designated GAM RNA, on one or more GAM336212 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336212 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336212 RNA, herein designated GAM RNA, of GAM336212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336212 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336212 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336212 RNA correlate with, and may be deduced from, the identity of the GAM336212 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336213 7103 TGAGAGGACT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTTGAACTC detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGGTGGAGG Messenger 336213 (GAM336213) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCAAGATCGC GAM336213 is a novel bioinformatically detectable regulatory, non protein

CCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336213 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAATGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGACCCCTC encoded by the human genome.

A GAM336213 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336213 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336213 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336213 precursor RNA is designated SEQ ID:7103, and is provided hereinbelow with reference to the sequence listing part.

GAM336213 precursor RNA folds onto itself, forming GAM336213 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336213 precursor RNA, designated SEQ ID NO: 7103, and a schematic representation of a predicted secondary folding of GAM336213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336213 folded precursor RNA yielding a GAM336213 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336213 RNA, hereby incorporated herein. Expression of GAM336213 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336213 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336213 target RNA, herein designated GAM TARGET RNA.

GAM336213 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336213 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336213 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336213 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336213 RNA, herein designated GAM RNA, to target binding sites on GAM336213 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336213 target RNA into GAM336213 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336213 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336213 target genes. The mRNA of each one of this

plurality of GAM336213 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336213 RNA, herein designated GAM RNA, and which when bound by GAM336213 RNA causes inhibition of translation of the GAM336213 target mRNA into a corresponding GAM336213 target protein.

The mechanism of the translational inhibition exerted by GAM336213 RNA, herein designated GAM RNA, on one or more GAM336213 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336213 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336213 RNA, herein designated GAM RNA, of GAM336213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336213 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336213 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336213 RNA correlate with, and may be deduced from, the identity of the GAM336213 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336214 7110 TGAGGCACAA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGAGATCGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336216 was detected

GCCACTGCAC is described with additional reference to Figs. 9-15.

TCCAGCCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCAACAGAGT encoded by the human genome.

GAGACTCCAT GAM336216 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTCA GAM336216 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336216 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336216 precursor RNA is designated SEQ ID:7124, and is provided hereinbelow with reference to the sequence listing part.

GAM336216 precursor RNA folds onto itself, forming GAM336216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336216 precursor RNA, designated SEQ ID NO: 7124, and a schematic representation of a predicted secondary folding of GAM336216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336216 folded precursor RNA yielding a GAM336216 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336216 RNA, hereby incorporated herein. Expression of GAM336216 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336216 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336216 target RNA, herein designated GAM TARGET RNA.

GAM336216 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336216 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336216 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336216 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336216 RNA, herein designated GAM RNA, to target binding sites on GAM336216 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336216 target RNA into GAM336216 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336216 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336216 target genes. The mRNA of each one of this plurality of GAM336216 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336216 RNA, herein designated GAM RNA, and which when bound by GAM336216 RNA causes inhibition of translation of the GAM336216 target mRNA into a corresponding GAM336216 target protein.

The mechanism of the translational inhibition exerted by GAM336216 RNA, herein designated GAM RNA, on one or more GAM336216 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336216 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336216 RNA, herein designated GAM RNA, of GAM336216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336216 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336216 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336216

RNA correlate with, and may be deduced from, the identity of the GAM336216 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336217 7127 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATAGGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCAGGAG Messenger 336217 (GAM336217) oligonucleotides modulates expression of respective target
GTGGAGCTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336217 is a novel bioinformatically detectable regulatory, non protein
AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336217 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGCGAG encoded by the human genome.

ACTCCGTCTC GAM336217 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM336217 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336217 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336217 precursor RNA is designated SEQ ID:7127, and is provided hereinbelow with reference to the sequence listing part.

GAM336217 precursor RNA folds onto itself, forming GAM336217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336217 precursor RNA, designated SEQ ID NO: 7127, and a schematic representation of a predicted secondary folding of GAM336217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336217 folded precursor RNA yielding a GAM336217 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336217 RNA, hereby incorporated herein. Expression of GAM336217 RNA was experimentally validated in HeLa cells using the methods

described with reference to Figs.22 to 24.

GAM336217 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336217 target RNA, herein designated GAM TARGET RNA.

GAM336217 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336217 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336217 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336217 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336217 RNA, herein designated GAM RNA, to target binding sites on GAM336217 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336217 target RNA into GAM336217 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336217 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336217 target genes. The mRNA of each one of this plurality of GAM336217 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336217 RNA, herein designated GAM RNA, and which when bound by GAM336217 RNA causes inhibition of translation of the GAM336217 target mRNA into a corresponding GAM336217 target protein.

The mechanism of the translational inhibition exerted by GAM336217 RNA, herein designated GAM RNA, on one or more GAM336217 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336217 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336217 RNA, herein designated GAM RNA, of GAM336217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336217 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336217 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336217 RNA correlate with, and may be deduced from, the identity of the GAM336217 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336218 7128 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCAAGAG Messenger 336218 (GAM336218) oligonucleotides modulates expression of respective target
GCGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCTG GAM336218 is a novel bioinformatically detectable regulatory, non protein
AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336218 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCAA encoded by the human genome.

AACTCCGTCT GAM336218 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM336218 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336218 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336218 precursor RNA is designated SEQ ID:7128, and is provided hereinbelow with reference to the sequence listing part.

GAM336218 precursor RNA folds onto itself, forming GAM336218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336218 precursor RNA, designated SEQ ID NO: 7128, and a schematic representation of a predicted secondary folding of GAM336218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336218 folded precursor RNA yielding a GAM336218 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336218 RNA, hereby incorporated herein. Expression of GAM336218 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336218 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336218 target RNA, herein designated GAM TARGET RNA.

GAM336218 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336218 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336218 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336218 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336218 RNA, herein designated GAM RNA, to target binding sites on GAM336218 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336218 target RNA into GAM336218 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336218 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336218 target genes. The mRNA of each one of this plurality of GAM336218 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336218 RNA, herein designated GAM RNA, and which when bound by GAM336218 RNA causes inhibition of translation of the GAM336218 target mRNA into a corresponding GAM336218 target protein.

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336221 RNA, herein designated GAM RNA, to target binding sites on GAM336221 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336221 target RNA into GAM336221 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336221 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336221 target genes. The mRNA of each one of this plurality of GAM336221 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336221 RNA, herein designated GAM RNA, and which when bound by GAM336221 RNA causes inhibition of translation of the GAM336221 target mRNA into a corresponding GAM336221 target protein.

The mechanism of the translational inhibition exerted by GAM336221 RNA, herein designated GAM RNA, on one or more GAM336221 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336221 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336221 RNA, herein designated GAM RNA, of GAM336221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336221 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336221 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336221 RNA correlate with, and may be deduced from, the identity of the GAM336221 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336222 7152 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCTAGGAG Messenger 336222 (GAM336222) oligonucleotides modulates expression of respective target

GCGGAGGTTC genes whose function and utility is known in the art.

CAGTGAGCTG GAM336222 is a novel bioinformatically detectable regulatory, non protein
AGATGGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336222 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGTGAG encoded by the human genome.

ACTGTCTCA GAM336222 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336222 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336222 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336222 precursor RNA is designated SEQ ID:7152, and is provided hereinbelow with reference to the sequence listing part.

GAM336222 precursor RNA folds onto itself, forming GAM336222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336222 precursor RNA, designated SEQ ID NO: 7152, and a schematic representation of a predicted secondary folding of GAM336222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336222 folded precursor RNA yielding a GAM336222 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336222 RNA, hereby incorporated herein. Expression of GAM336222 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336222 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336222 target RNA, herein designated GAM TARGET RNA.

GAM336222 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336222 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336222 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336222 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336222 RNA, herein designated GAM RNA, to target binding sites on GAM336222 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336222 target RNA into GAM336222 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336222 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336222 target genes. The mRNA of each one of this plurality of GAM336222 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336222 RNA, herein designated GAM RNA, and which when bound by GAM336222 RNA causes inhibition of translation of the GAM336222 target mRNA into a corresponding GAM336222 target protein.

The mechanism of the translational inhibition exerted by GAM336222 RNA, herein designated GAM RNA, on one or more GAM336222 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336222 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336222 RNA, herein designated GAM RNA, of GAM336222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336222 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336222 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336222 RNA correlate with, and may be deduced from, the identity of the GAM336222 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336223 7154 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATGGCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCTAGGAG Messenger 336223 (GAM336223) oligonucleotides modulates expression of respective target
GTGGAGCTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336223 is a novel bioinformatically detectable regulatory, non protein
AGATAGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336223 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGCGAG encoded by the human genome.

ACTCTGTCTC GAM336223 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM336223 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336223 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336223 precursor RNA is designated SEQ ID:7154, and is provided hereinbelow with reference to the sequence listing part.

GAM336223 precursor RNA folds onto itself, forming GAM336223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336223 precursor RNA, designated SEQ ID NO: 7154, and a schematic representation of a predicted secondary folding of GAM336223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336223 folded precursor RNA yielding a GAM336223 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336223 RNA, hereby incorporated herein. Expression of GAM336223 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336223 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336223 target RNA, herein designated GAM TARGET RNA.

GAM336223 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336223 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336223 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336223 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336223 RNA, herein designated GAM RNA, to target binding sites on GAM336223 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336223 target RNA into GAM336223 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336223 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336223 target genes. The mRNA of each one of this plurality of GAM336223 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336223 RNA, herein designated GAM RNA, and which when bound by GAM336223 RNA causes inhibition of translation of the GAM336223 target mRNA into a corresponding GAM336223 target protein.

The mechanism of the translational inhibition exerted by GAM336223 RNA, herein designated GAM RNA, on one or more GAM336223 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336223 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336223 RNA, herein designated GAM RNA, of GAM336223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336223 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336223 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336223 RNA correlate with, and may be deduced from, the identity of the GAM336223 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336224 7161 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAM336226 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336226 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336226 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336226 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336226 RNA, herein designated GAM RNA, to target binding sites on GAM336226 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336226 target RNA into GAM336226 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336226 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336226 target genes. The mRNA of each one of this plurality of GAM336226 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336226 RNA, herein designated GAM RNA, and which when bound by GAM336226 RNA causes inhibition of translation of the GAM336226 target mRNA into a corresponding GAM336226 target protein.

The mechanism of the translational inhibition exerted by GAM336226 RNA, herein designated GAM RNA, on one or more GAM336226 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336226 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336226 RNA, herein designated GAM RNA, of GAM336226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336226 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336226 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336226 RNA correlate with, and may be deduced from, the identity of the GAM336226 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336227 7167 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGTCGCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCTGAGAG Messenger 336227 (GAM336227) oligonucleotides modulates expression of respective target
GCGGAGCTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336227 is a novel bioinformatically detectable regulatory, non protein
AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336227 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACACAGCGAG encoded by the human genome.

ACTCCGTCTC GAM336227 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336227 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336227 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336227 precursor RNA is designated SEQ ID:7167, and is provided hereinbelow with reference to the sequence listing part.

GAM336227 precursor RNA folds onto itself, forming GAM336227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336227 precursor RNA, designated SEQ ID NO: 7167, and a schematic representation of a predicted secondary folding of GAM336227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336227 folded precursor RNA yielding a GAM336227 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336227 RNA, hereby incorporated herein. Expression of GAM336227 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336227 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336227 target RNA, herein designated GAM TARGET RNA.

GAM336227 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336227 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336227 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336227 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336227 RNA, herein designated GAM RNA, to target binding sites on GAM336227 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336227 target RNA into GAM336227 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336227 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336227 target genes. The mRNA of each one of this plurality of GAM336227 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336227 RNA, herein designated GAM RNA, and which when bound by GAM336227 RNA causes inhibition of translation of the GAM336227 target mRNA into a corresponding GAM336227 target protein.

The mechanism of the translational inhibition exerted by GAM336227 RNA, herein designated GAM RNA, on one or more GAM336227 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336227 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336227 RNA, herein designated GAM RNA, of GAM336227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336227 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336227 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336227 RNA correlate with, and may be deduced from, the identity of the GAM336227 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336228 7168 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGATTGCTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAGGAG Messenger 336228 (GAM336228) oligonucleotides modulates expression of respective target

CTGGAGGCTG genes whose function and utility is known in the art.

CAGTGAGCTA GAM336228 is a novel bioinformatically detectable regulatory, non protein

TGATCATGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336228 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAATAAT encoded by the human genome.

ATCCTGCCTC GAM336228 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336228 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336228 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336228 precursor RNA is designated SEQ ID:7168, and is provided hereinbelow with reference to the sequence listing part.

GAM336228 precursor RNA folds onto itself, forming GAM336228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336228 precursor RNA, designated SEQ ID NO: 7168, and a schematic representation of a predicted secondary folding of GAM336228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336228 folded precursor RNA yielding a GAM336228 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336228 RNA, hereby incorporated herein. Expression of GAM336228 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336228 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336228 target RNA, herein designated GAM TARGET RNA.

GAM336228 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336228 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336228 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336228 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336228 RNA, herein designated GAM RNA, to target binding sites on GAM336228 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336228 target RNA into GAM336228 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336228 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336228 target genes. The mRNA of each one of this plurality of GAM336228 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336228 RNA, herein designated GAM RNA, and which when bound by GAM336228 RNA causes inhibition of translation of the GAM336228 target mRNA into a corresponding GAM336228 target protein.

The mechanism of the translational inhibition exerted by GAM336228 RNA, herein designated GAM RNA, on one or more GAM336228 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336228 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336228 RNA, herein designated GAM RNA, of GAM336228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336228 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336228 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336228 RNA correlate with, and may be deduced from, the identity of the GAM336228 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336229 7169 TGAGGCAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336231 folded precursor RNA yielding a GAM336231 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336231 RNA, hereby incorporated herein. Expression of GAM336231 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336231 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336231 target RNA, herein designated GAM TARGET RNA.

GAM336231 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336231 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336231 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336231 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336231 RNA, herein designated GAM RNA, to target binding sites on GAM336231 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336231 target RNA into GAM336231 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336231 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336231 target genes. The mRNA of each one of this plurality of GAM336231 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336231 RNA, herein designated GAM RNA, and which when bound by GAM336231 RNA causes inhibition of translation of the GAM336231 target mRNA into a corresponding GAM336231 target protein.

The mechanism of the translational inhibition exerted by GAM336231 RNA, herein designated GAM RNA, on one or more GAM336231 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336231 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336231 RNA, herein designated GAM RNA, of GAM336231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336231 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336231 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336231 RNA correlate with, and may be deduced from, the identity of the GAM336231 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336232 7176 TGAGGTACGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CAATTGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAGGAG Messenger 336232 (GAM336232) oligonucleotides modulates expression of respective target

GTGGAGGCTG genes whose function and utility is known in the art.

CAGTGAGTGA GAM336232 is a novel bioinformatically detectable regulatory, non protein

GATCACACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336232 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGTGAGA encoded by the human genome.

CCCTATCTCA GAM336232 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336232 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336232 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336232 precursor RNA is designated SEQ ID:7176, and is provided hereinbelow with reference to the sequence listing part.

GAM336232 precursor RNA folds onto itself, forming GAM336232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336232 precursor RNA, designated SEQ ID NO: 7176, and a schematic representation of a predicted secondary folding of GAM336232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336232 folded precursor RNA yielding a GAM336232 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336232 RNA, hereby incorporated herein. Expression of GAM336232 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336232 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336232 target RNA, herein designated GAM TARGET RNA.

GAM336232 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336232 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336232 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336232 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336232 RNA, herein designated GAM RNA, to target binding sites on GAM336232 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336232 target RNA into GAM336232 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336232 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336232 target genes. The mRNA of each one of this plurality of GAM336232 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336232 RNA,

herein designated GAM RNA, and which when bound by GAM336232 RNA causes inhibition of translation of the GAM336232 target mRNA into a corresponding GAM336232 target protein.

The mechanism of the translational inhibition exerted by GAM336232 RNA, herein designated GAM RNA, on one or more GAM336232 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336232 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336232 RNA, herein designated GAM RNA, of GAM336232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336232 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336232 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336232 RNA correlate with, and may be deduced from, the identity of the GAM336232 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336233 7212 TGCTTGAACC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAAAAGGCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTTGCAGT Messenger 336233 (GAM336233) oligonucleotides modulates expression of respective target

GAGCCAAGAT genes whose function and utility is known in the art.

TGTGCCACTG GAM336233 is a novel bioinformatically detectable regulatory, non protein

CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336233 was detected

TGGGCAACAG is described with additional reference to Figs. 9-15.

AGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336233 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336233 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336233 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336233 precursor RNA is designated SEQ ID:7212, and is provided hereinbelow with reference to the sequence listing part.

GAM336233 precursor RNA folds onto itself, forming GAM336233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336233 precursor RNA, designated SEQ ID NO: 7212, and a schematic representation of a predicted secondary folding of GAM336233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336233 folded precursor RNA yielding a GAM336233 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336233 RNA, hereby incorporated herein. Expression of GAM336233 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336233 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336233 target RNA, herein designated GAM TARGET RNA.

GAM336233 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336233 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336233 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336233 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336233 RNA, herein designated GAM RNA, to target binding sites on GAM336233 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336233 target RNA

into GAM336233 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336233 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336233 target genes. The mRNA of each one of this plurality of GAM336233 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336233 RNA, herein designated GAM RNA, and which when bound by GAM336233 RNA causes inhibition of translation of the GAM336233 target mRNA into a corresponding GAM336233 target protein.

The mechanism of the translational inhibition exerted by GAM336233 RNA, herein designated GAM RNA, on one or more GAM336233 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336233 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336233 RNA, herein designated GAM RNA, of GAM336233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336233 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336233 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336233 RNA correlate with, and may be deduced from, the identity of the GAM336233 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336234 7213 TGCTTGAACT Fig. 8 further provides a conceptual description of another novel bioinformatically

CGGGGTGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTGCAGTGA Messenger 336234 (GAM336234) oligonucleotides modulates expression of respective target

GCCAAGATCG genes whose function and utility is known in the art.

CCCCACTGCA GAM336234 is a novel bioinformatically detectable regulatory, non protein

CTCCAGCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336234 was detected

GGCAACAATG is described with additional reference to Figs. 9-15.

CA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336234 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336234 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336234 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336234 precursor RNA is designated SEQ ID:7213, and is provided hereinbelow with reference to the sequence listing part.

GAM336234 precursor RNA folds onto itself, forming GAM336234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336234 precursor RNA, designated SEQ ID NO: 7213, and a schematic representation of a predicted secondary folding of GAM336234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336234 folded precursor RNA yielding a GAM336234 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336234 RNA, hereby incorporated herein. An enzyme complex designated DICER COMPLEX, `dices` the GAM336236 folded precursor RNA yielding a GAM336236 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336236 RNA, hereby incorporated herein. Expression of GAM336236 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336236 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336236 target RNA, herein designated GAM TARGET RNA.

GAM336236 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336236 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336236 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336236 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336236 RNA, herein designated GAM RNA, to target binding sites on GAM336236 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336236 target RNA into GAM336236 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336236 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336236 target genes. The mRNA of each one of this plurality of GAM336236 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336236 RNA, herein designated GAM RNA, and which when bound by GAM336236 RNA causes inhibition of translation of the GAM336236 target mRNA into a corresponding GAM336236 target protein.

The mechanism of the translational inhibition exerted by GAM336236 RNA, herein designated GAM RNA, on one or more GAM336236 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336236 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336236 RNA, herein designated GAM RNA, of GAM336236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336236 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336236 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336236 RNA correlate with, and may be deduced from, the identity of the GAM336236 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336237 7309 TTGAACCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGGCGGAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGCAGTGAG Messenger 336237 (GAM336237) oligonucleotides modulates expression of respective target
CCGAGATGGC genes whose function and utility is known in the art.

ACCACTGCAC GAM336237 is a novel bioinformatically detectable regulatory, non protein
TCCAGCCTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336237 was detected
GCAACAA is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336237 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336237 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336237 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336237 precursor RNA is designated SEQ ID:7309, and is provided hereinbelow with reference to the sequence listing part.

GAM336237 precursor RNA folds onto itself, forming GAM336237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336237 precursor RNA, designated SEQ ID NO: 7309, and a schematic representation of a predicted secondary folding of GAM336237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336237 folded precursor

RNA yielding a GAM336237 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336237 RNA, hereby incorporated herein. Expression of GAM336237 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336237 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336237 target RNA, herein designated GAM TARGET RNA.

GAM336237 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336237 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336237 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336237 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336237 RNA, herein designated GAM RNA, to target binding sites on GAM336237 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336237 target RNA into GAM336237 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336237 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336237 target genes. The mRNA of each one of this plurality of GAM336237 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336237 RNA, herein designated GAM RNA, and which when bound by GAM336237 RNA causes inhibition of translation of the GAM336237 target mRNA into a corresponding GAM336237 target protein.

The mechanism of the translational inhibition exerted by GAM336237 RNA, herein designated GAM RNA, on one or more GAM336237 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336237 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336237 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336237 RNA, herein designated GAM RNA, of GAM336237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336237 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336237 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336237 RNA correlate with, and may be deduced from, the identity of the GAM336237 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336238 7314 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically
CCAGGAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTTGCAG Messenger 336238 (GAM336238) oligonucleotides modulates expression of respective target
TGAGCCAAGA genes whose function and utility is known in the art.

TTGTGCCACT GAM336238 is a novel bioinformatically detectable regulatory, non protein
GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336238 was detected
CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336238 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336238 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336238 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336238 precursor RNA is designated SEQ ID:7314, and is provided hereinbelow with reference to the sequence listing part.

GAM336238 precursor RNA folds onto itself, forming GAM336238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336238 precursor RNA, designated SEQ ID NO: 7314, and a schematic representation of a predicted secondary folding of GAM336238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336238 folded precursor RNA yielding a GAM336238 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336238 RNA, hereby incorporated herein. Expression of GAM336238 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336238 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336238 target RNA, herein designated GAM TARGET RNA.

GAM336238 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336238 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336238 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336238 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336238 RNA, herein designated GAM RNA, to target binding sites on GAM336238 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336238 target RNA into GAM336238 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336238 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336238 target genes. The mRNA of each one of this plurality of GAM336238 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336238 RNA, herein designated GAM RNA, and which when bound by GAM336238 RNA causes inhibition of translation of the GAM336238 target mRNA into a corresponding GAM336238 target protein.

The mechanism of the translational inhibition exerted by GAM336238 RNA, herein

designated GAM RNA, on one or more GAM336238 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336238 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336238 RNA, herein designated GAM RNA, of GAM336238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336238 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336238 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336238 RNA correlate with, and may be deduced from, the identity of the GAM336238 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336239 7316 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAGGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 336239 (GAM336239) oligonucleotides modulates expression of respective target

TGAGCTGAGA genes whose function and utility is known in the art.

CCATGCCATT GAM336239 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336239 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336239 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336239 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336239 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336239 precursor RNA is designated SEQ ID:7316, and is provided hereinbelow with reference to the sequence listing part.

GAM336239 precursor RNA folds onto itself, forming GAM336239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336239 precursor RNA, designated SEQ ID NO: 7316, and a schematic representation of a predicted secondary folding of GAM336239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336239 folded precursor RNA yielding a GAM336239 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336239 RNA, hereby incorporated herein. Expression of GAM336239 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336239 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336239 target RNA, herein designated GAM TARGET RNA.

GAM336239 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336239 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336239 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336239 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336239 RNA, herein designated GAM RNA, to target binding sites on GAM336239 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336239 target RNA into GAM336239 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336239 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336239 target genes. The mRNA of each one of this plurality of GAM336239 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336239 RNA, herein designated GAM RNA, and which when bound by GAM336239 RNA causes inhibition of translation of the GAM336239 target mRNA into a corresponding GAM336239 target protein.

The mechanism of the translational inhibition exerted by GAM336239 RNA, herein designated GAM RNA, on one or more GAM336239 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336239 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336239 RNA, herein designated GAM RNA, of GAM336239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336239 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336239 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336239 RNA correlate with, and may be deduced from, the identity of the GAM336239 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336240 7322 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGGGAGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTTCAG Messenger 336240 (GAM336240) oligonucleotides modulates expression of respective target

TGAGCCGAGC genes whose function and utility is known in the art.

CGAGATTGTG GAM336240 is a novel bioinformatically detectable regulatory, non protein

TCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336240 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

A encoded by the human genome.

GAM336240 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336240 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336240 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336240 precursor RNA is designated SEQ ID:7322, and is provided hereinbelow with reference to the sequence listing part.

GAM336240 precursor RNA folds onto itself, forming GAM336240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336240 precursor RNA, designated SEQ ID NO: 7322, and a schematic representation of a predicted secondary folding of GAM336240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336240 folded precursor RNA yielding a GAM336240 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336240 RNA, hereby incorporated herein. Expression of GAM336240 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336240 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336240 target RNA, herein designated GAM TARGET RNA.

GAM336240 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336240 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336240 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336240 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336240 RNA, herein designated GAM RNA, to target

binding sites on GAM336240 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336240 target RNA into GAM336240 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336240 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336240 target genes. The mRNA of each one of this plurality of GAM336240 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336240 RNA, herein designated GAM RNA, and which when bound by GAM336240 RNA causes inhibition of translation of the GAM336240 target mRNA into a corresponding GAM336240 target protein.

The mechanism of the translational inhibition exerted by GAM336240 RNA, herein designated GAM RNA, on one or more GAM336240 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336240 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336240 RNA, herein designated GAM RNA, of GAM336240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336240 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336240 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336240 RNA correlate with, and may be deduced from, the identity of the GAM336240 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336241 RNA, hereby incorporated herein. Expression of GAM336241 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336241 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336241 target RNA, herein designated GAM TARGET RNA.

GAM336241 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336241 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336241 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336241 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336241 RNA, herein designated GAM RNA, to target binding sites on GAM336241 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336241 target RNA into GAM336241 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336241 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336241 target genes. The mRNA of each one of this plurality of GAM336241 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336241 RNA, herein designated GAM RNA, and which when bound by GAM336241 RNA causes inhibition of translation of the GAM336241 target mRNA into a corresponding GAM336241 target protein.

The mechanism of the translational inhibition exerted by GAM336241 RNA, herein designated GAM RNA, on one or more GAM336241 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336241 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336241 RNA, herein designated GAM RNA, of GAM336241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336241 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336241 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336241 RNA correlate with, and may be deduced from, the identity of the GAM336241 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336242 7325 TTGCTTGAGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAGGAGCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

AAAGCTGCAG Messenger 336242 (GAM336242) oligonucleotides modulates expression of respective target

TAAGTGGTGA genes whose function and utility is known in the art.

CTTGCCACTG GAM336242 is a novel bioinformatically detectable regulatory, non protein
CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336242 was detected

TGGGCAACAA is described with additional reference to Figs. 9-15.

AGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336242 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336242 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336242 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336242 precursor RNA is designated SEQ ID:7325, and is provided hereinbelow with reference to the sequence listing part.

GAM336242 precursor RNA folds onto itself, forming GAM336242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336242 precursor RNA, designated SEQ ID NO: 7325, and a schematic representation of a predicted secondary folding of GAM336242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336242 folded precursor RNA yielding a GAM336242 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336242 RNA, hereby incorporated herein. Expression of GAM336242 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336242 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336242 target RNA, herein designated GAM TARGET RNA.

GAM336242 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336242 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336242 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336242 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336242 RNA, herein designated GAM RNA, to target binding sites on GAM336242 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336242 target RNA into GAM336242 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336242 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336242 target genes. The mRNA of each one of this plurality of GAM336242 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336242 RNA, herein designated GAM RNA, and which when bound by GAM336242 RNA causes inhibition of translation of the GAM336242 target mRNA into a corresponding GAM336242 target protein.

The mechanism of the translational inhibition exerted by GAM336242 RNA, herein designated GAM RNA, on one or more GAM336242 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336242 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336242 RNA, herein designated GAM RNA, of GAM336242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336242 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336242 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336242 RNA correlate with, and may be deduced from, the identity of the GAM336242 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336243 7326 TTGCTTGAGC Fig. 8 further provides a conceptual description of another novel bioinformatically
CCCAGAGTTT detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCTGCAG Messenger 336243 (GAM336243) oligonucleotides modulates expression of respective target
TGAGCTGTGA genes whose function and utility is known in the art.

TCACACCACT GAM336243 is a novel bioinformatically detectable regulatory, non protein
GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336243 was detected
CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336243 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336243 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336243 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336243 precursor RNA is designated SEQ ID:7326, and is provided hereinbelow with reference to the sequence listing part.

GAM336243 precursor RNA folds onto itself, forming GAM336243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336243 precursor RNA, designated SEQ ID NO: 7326, and a schematic representation of a predicted secondary folding of GAM336243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336243 folded precursor RNA yielding a GAM336243 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336243 RNA, hereby incorporated herein. Expression of GAM336243 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336243 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336243 target RNA, herein designated GAM TARGET RNA.

GAM336243 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336243 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336243 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336243 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336243 RNA, herein designated GAM RNA, to target binding sites on GAM336243 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336243 target RNA into GAM336243 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336243 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336243 target genes. The mRNA of each one of this plurality of GAM336243 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336243 RNA, herein designated GAM RNA, and which when bound by GAM336243 RNA causes inhibition of translation of the GAM336243 target mRNA into a corresponding GAM336243 target protein.

The mechanism of the translational inhibition exerted by GAM336243 RNA, herein designated GAM RNA, on one or more GAM336243 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336243 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336243 RNA, herein designated GAM RNA, of GAM336243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336243 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336243 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336243 RNA correlate with, and may be deduced from, the identity of the GAM336243 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336244 7329 TTGGAGCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAAGGTTGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTGCAGTGA Messenger 336244 (GAM336244) oligonucleotides modulates expression of respective target
GCTGTGATCA genes whose function and utility is known in the art.

TGCCACTGCA GAM336244 is a novel bioinformatically detectable regulatory, non protein
CTCCAGCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336244 was detected
GGCAACAG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336244 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336244 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336244 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336244 precursor RNA is designated SEQ ID:7329, and is provided hereinbelow with reference to the sequence listing part.

GAM336244 precursor RNA folds onto itself, forming GAM336244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336244 precursor RNA, designated SEQ ID NO: 7329, and a schematic representation of a predicted secondary folding of GAM336244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336244 folded precursor RNA yielding a GAM336244 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336244 RNA, hereby incorporated herein. Expression of GAM336244 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336244 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336244 target RNA, herein designated GAM TARGET RNA.

GAM336244 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336244 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336244 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336244 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336244 RNA, herein designated GAM RNA, to target binding sites on GAM336244 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336244 target RNA into GAM336244 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336244 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336244 target genes. The mRNA of each one of this plurality of GAM336244 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336244 RNA, herein designated GAM RNA, and which when bound by GAM336244 RNA causes inhibition of translation of the GAM336244 target mRNA into a corresponding GAM336244 target protein.

The mechanism of the translational inhibition exerted by GAM336244 RNA, herein designated GAM RNA, on one or more GAM336244 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336244 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336244 RNA, herein designated GAM RNA, of GAM336244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336244 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336244 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336244 RNA correlate with, and may be deduced from, the identity of the GAM336244 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336245 6836 GGTCCAGATG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGCCATGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGACTGAGGG Messenger 336245 (GAM336245) oligonucleotides modulates expression of respective target

GCGGACGTGT genes whose function and utility is known in the art.

TCCTGGGTGC GAM336245 is a novel bioinformatically detectable regulatory, non protein

TTCCTTCATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336245 was detected

TCAGTCTCCT is described with additional reference to Figs. 9-15.

CACTGAGACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336245 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336245 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336245 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336245 precursor RNA is designated SEQ ID:6836, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6836 is located from position 253589 to position 253668 relative to chromosome 16 on the `+` strand.

GAM336245 precursor RNA folds onto itself, forming GAM336245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336245 precursor RNA, designated SEQ ID NO: 6836, and a schematic representation of a predicted secondary folding of GAM336245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336245 folded precursor RNA yielding a GAM336245 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336245 RNA, hereby incorporated herein.

GAM336245 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336245 target RNA, herein designated GAM TARGET RNA.

GAM336245 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336245 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336245 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336245 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336245 RNA, herein designated GAM RNA, to target binding sites on GAM336245 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336245 target RNA into GAM336245 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336245 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336245 target genes. The mRNA of each one of this plurality of GAM336245 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336245 RNA, herein designated GAM RNA, and which when bound by GAM336245 RNA causes inhibition of translation of the GAM336245 target mRNA into a corresponding GAM336245 target protein.

The mechanism of the translational inhibition exerted by GAM336245 RNA, herein designated GAM RNA, on one or more GAM336245 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336245 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336245 RNA, herein designated GAM RNA, of GAM336245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336245 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336245 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336245 RNA correlate with, and may be deduced from, the identity of the GAM336245 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336246 5803 AGTCACCAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCCATTGTA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTAGTCTTAT Messenger 336246 (GAM336246) oligonucleotides modulates expression of respective target

TTTCATCACC genes whose function and utility is known in the art.

GTGGGCGTAC GAM336246 is a novel bioinformatically detectable regulatory, non protein

CCTGTGGGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336246 was detected

GATGTTAAAC is described with additional reference to Figs. 9-15.

GTACTCTAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTCTGTTGGC encoded by the human genome.

T GAM336246 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336246 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336246 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336246 precursor RNA is designated SEQ ID:5803, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5803 is located from position 265415 to position 265505 relative to chromosome 12 on the `-` strand.

GAM336246 precursor RNA folds onto itself, forming GAM336246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336246 precursor RNA, designated SEQ ID NO: 5803, and a schematic representation of a predicted secondary folding of GAM336246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336246 folded precursor RNA yielding a GAM336246 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336246 RNA, hereby incorporated herein.

GAM336246 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336246 target RNA, herein designated GAM TARGET RNA.

GAM336246 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336246 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336246 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336246 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336246 RNA, herein designated GAM RNA, to target binding sites on GAM336246 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336246 target RNA into GAM336246 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336246 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336246 target genes. The mRNA of each one of this plurality of GAM336246 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM336246 RNA, herein designated GAM RNA, and which when bound by GAM336246 RNA causes inhibition of translation of the GAM336246 target mRNA into a corresponding GAM336246 target protein.

The mechanism of the translational inhibition exerted by GAM336246 RNA, herein designated GAM RNA, on one or more GAM336246 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336246 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336246 RNA, herein designated GAM RNA, of GAM336246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336246 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336246 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336246 RNA correlate with, and may be deduced from, the identity of the GAM336246 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTGAACCCGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 336247 (GAM336247) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCAAGATCAC GAM336247 is a novel bioinformatically detectable regulatory, non protein

ATCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336247 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GTGACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGACTCC encoded by the human genome.

GAM336247 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336247 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336247 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336247 precursor RNA is designated SEQ ID:6642, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6642 is located from position 377662 to position 377749 relative to chromosome 16 on the `+` strand.

GAM336247 precursor RNA folds onto itself, forming GAM336247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336247 precursor RNA, designated SEQ ID NO: 6642, and a schematic representation of a predicted secondary folding of GAM336247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336247 folded precursor RNA yielding a GAM336247 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336247 RNA, hereby incorporated herein.

GAM336247 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336247 target RNA, herein designated GAM TARGET RNA.

GAM336247 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336247 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336247 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336247 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336247 RNA, herein designated GAM RNA, to target binding sites on GAM336247 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336247 target RNA

into GAM336247 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336247 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336247 target genes. The mRNA of each one of this plurality of GAM336247 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336247 RNA, herein designated GAM RNA, and which when bound by GAM336247 RNA causes inhibition of translation of the GAM336247 target mRNA into a corresponding GAM336247 target protein.

The mechanism of the translational inhibition exerted by GAM336247 RNA, herein designated GAM RNA, on one or more GAM336247 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336247 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336247 RNA, herein designated GAM RNA, of GAM336247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336247 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336247 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336247 RNA correlate with, and may be deduced from, the identity of the GAM336247 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336251 7050 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAGGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 336251 (GAM336251) oligonucleotides modulates expression of respective target

TGAATGAAGA genes whose function and utility is known in the art.

TCGTGCCACT GAM336251 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336251 was detected

CTGGGCGATA is described with additional reference to Figs. 9-15.

GAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336251 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336251 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336251 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336251 precursor RNA is designated SEQ ID:7050, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7050 is located from position 851357 to position 851432 relative to chromosome 19 on the `+` strand.

GAM336251 precursor RNA folds onto itself, forming GAM336251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336251 precursor RNA, designated SEQ ID NO: 7050, and a schematic representation of a predicted secondary folding of GAM336251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336251 folded precursor RNA yielding a GAM336251 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336251 RNA, hereby incorporated herein.

GAM336251 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336251 target RNA, herein designated GAM TARGET RNA.

GAM336251 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336251 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336251 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336251 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336251 RNA, herein designated GAM RNA, to target binding sites on GAM336251 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336251 target RNA into GAM336251 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336251 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336251 target genes. The mRNA of each one of this plurality of GAM336251 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336251 RNA, herein designated GAM RNA, and which when bound by GAM336251 RNA causes inhibition of translation of the GAM336251 target mRNA into a corresponding GAM336251 target protein.

The mechanism of the translational inhibition exerted by GAM336251 RNA, herein designated GAM RNA, on one or more GAM336251 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336251 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336251 RNA, herein designated GAM RNA, of GAM336251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336251 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336251 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336251 RNA correlate with, and may be deduced from, the identity of the GAM336251 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336252 6200 CTGAGCTTAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTATCTTTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTTCAATTC Messenger 336252 (GAM336252) oligonucleotides modulates expression of respective target

ACCGGAGTCT genes whose function and utility is known in the art.

CAAAACCTGG GAM336252 is a novel bioinformatically detectable regulatory, non protein
CAGGTGTTAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336252 was detected
CATCTTCCTG is described with additional reference to Figs. 9-15.

AGGCACCGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGTCGGGACT encoded by the human genome.

GCCAGAGGCC GAM336252 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TGCACAG GAM336252 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336252 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336252 precursor RNA is designated SEQ ID:6200, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6200 is located from position 960158 to position 960264 relative to chromosome 17 on the `+` strand.

GAM336252 precursor RNA folds onto itself, forming GAM336252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336252 precursor RNA, designated SEQ ID NO: 6200, and a schematic representation of a predicted secondary folding of GAM336252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336252 folded precursor RNA yielding a GAM336252 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336252 RNA, hereby incorporated herein.

GAM336252 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336252 target RNA, herein designated GAM TARGET RNA.

GAM336252 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336252 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336252 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336252 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336252 RNA, herein designated GAM RNA, to target binding sites on GAM336252 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336252 target RNA into GAM336252 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336252 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336252 target genes. The mRNA of each one of this plurality of GAM336252 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336252 RNA, herein designated GAM RNA, and which when bound by GAM336252 RNA causes inhibition of translation of the GAM336252 target mRNA into a corresponding GAM336252 target protein.

The mechanism of the translational inhibition exerted by GAM336252 RNA, herein designated GAM RNA, on one or more GAM336252 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336252 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336252 RNA, herein designated GAM RNA, of GAM336252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336252 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336252 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336252 RNA correlate with, and may be deduced from, the identity of the GAM336252 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336255 6921 GTGTAGCATG Fig. 8 further provides a conceptual description of another novel bioinformatically
CATCAGTACT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCACCTACTG Messenger 336255 (GAM336255) oligonucleotides modulates expression of respective target
TATGGATATA genes whose function and utility is known in the art.

AAAATCCATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336255 was detected
CATTAGGCCA is described with additional reference to Figs. 9-15.

GGTGCGGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTCAC encoded by the human genome.

GAM336255 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336255 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336255 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336255 precursor RNA is designated SEQ ID:6921, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6921 is located from position 1228075 to position 1228159 relative to chromosome 17 on the `+` strand.

GAM336255 precursor RNA folds onto itself, forming GAM336255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336255 precursor RNA, designated SEQ ID NO: 6921, and a schematic representation of a predicted secondary folding of GAM336255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336255 folded precursor RNA yielding a GAM336255 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336255 RNA, hereby incorporated herein.

GAM336255 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336255 target RNA, herein designated GAM TARGET RNA.

GAM336255 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336255 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336255 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336255 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336255 RNA, herein designated GAM RNA, to target binding sites on GAM336255 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336255 target RNA into GAM336255 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336255 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336255 target genes. The mRNA of each one of this plurality of GAM336255 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336255 RNA, herein designated GAM RNA, and which when bound by GAM336255 RNA causes inhibition of translation of the GAM336255 target mRNA into a corresponding GAM336255 target protein.

The mechanism of the translational inhibition exerted by GAM336255 RNA, herein designated GAM RNA, on one or more GAM336255 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336255 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336255 RNA, herein designated GAM RNA, of GAM336255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336255 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336255 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336255 RNA correlate with, and may be deduced from, the identity of the GAM336255 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336257 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336257 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336257 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336257 precursor RNA is designated SEQ ID:6496, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6496 is located from position 1312908 to position 1312995 relative to chromosome 19 on the `+` strand.

GAM336257 precursor RNA folds onto itself, forming GAM336257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336257 precursor RNA, designated SEQ ID NO: 6496, and a schematic representation of a predicted secondary folding of GAM336257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336257 folded precursor RNA yielding a GAM336257 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336257 RNA, hereby incorporated herein.

GAM336257 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336257 target RNA, herein designated GAM TARGET RNA.

GAM336257 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336257 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336257 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336257 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336257 RNA, herein designated GAM RNA, to target binding sites on GAM336257 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336257 target RNA into GAM336257 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336257 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336257 target genes. The mRNA of each one of this plurality of GAM336257 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336257 RNA, herein designated GAM RNA, and which when bound by GAM336257 RNA causes inhibition of translation of the GAM336257 target mRNA into a corresponding GAM336257 target protein.

The mechanism of the translational inhibition exerted by GAM336257 RNA, herein designated GAM RNA, on one or more GAM336257 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336257 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336257 RNA, herein designated GAM RNA, of GAM336257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336257 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336257 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336257 RNA correlate with, and may be deduced from, the identity of the GAM336257 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336259 6548 GCTGTAACAC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGAGCAGGTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGAATGGCT Messenger 336259 (GAM336259) oligonucleotides modulates expression of respective target
CCACCCACAG genes whose function and utility is known in the art.

GGCCACAAGA GAM336259 is a novel bioinformatically detectable regulatory, non protein
AACAAACCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336259 was detected
TGGAGAGTTC is described with additional reference to Figs. 9-15.

CAGATCTGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCAGC encoded by the human genome.

GAM336259 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336259 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336259 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336259 precursor RNA is designated SEQ ID:6548, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6548 is located from position 1889566 to position 1889651 relative to chromosome 8 on the `+` strand.

GAM336259 precursor RNA folds onto itself, forming GAM336259 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336259 precursor RNA, designated SEQ ID NO: 6548, and a schematic representation of a predicted secondary folding of GAM336259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336259 folded precursor RNA yielding a GAM336259 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336259 RNA, hereby incorporated herein.

GAM336259 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336259 target RNA, herein designated GAM TARGET RNA.

GAM336259 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336259 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336259 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336259 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336259 RNA, herein designated GAM RNA, to target binding sites on GAM336259 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336259 target RNA into GAM336259 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336259 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336259 target genes. The mRNA of each one of this plurality of GAM336259 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336259 RNA,

herein designated GAM RNA, and which when bound by GAM336259 RNA causes inhibition of translation of the GAM336259 target mRNA into a corresponding GAM336259 target protein.

The mechanism of the translational inhibition exerted by GAM336259 RNA, herein designated GAM RNA, on one or more GAM336259 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336259 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336259 RNA, herein designated GAM RNA, of GAM336259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336259 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336259 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336259 RNA correlate with, and may be deduced from, the identity of the GAM336259 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336260 6463 GAGTCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTCGGGAGG Messenger 336260 (GAM336260) oligonucleotides modulates expression of respective target

TGGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCTAA GAM336260 is a novel bioinformatically detectable regulatory, non protein

GATCACACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336260 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGAGCGAA encoded by the human genome.

ACTCCATCTC GAM336260 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336260 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336260 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336260 precursor RNA is designated SEQ ID:6463, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6463 is located from position 1984914 to position 1985013 relative to chromosome X on the `+` strand.

GAM336260 precursor RNA folds onto itself, forming GAM336260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336260 precursor RNA, designated SEQ ID NO: 6463, and a schematic representation of a predicted secondary folding of GAM336260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336260 folded precursor RNA yielding a GAM336260 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336260 RNA, hereby incorporated herein. Expression of GAM336260 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336260 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336260 target RNA, herein designated GAM TARGET RNA.

GAM336260 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336260 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336260 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336260 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336260 RNA, herein designated GAM RNA, to target binding sites on GAM336260 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336260 target RNA into GAM336260 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336260 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336260 target genes. The mRNA of each one of this plurality of GAM336260 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336260 RNA, herein designated GAM RNA, and which when bound by GAM336260 RNA causes inhibition of translation of the GAM336260 target mRNA into a corresponding GAM336260 target protein.

The mechanism of the translational inhibition exerted by GAM336260 RNA, herein designated GAM RNA, on one or more GAM336260 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336260 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336260 RNA, herein designated GAM RNA, of GAM336260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336260 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336260 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336260 RNA correlate with, and may be deduced from, the identity of the GAM336260 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336261 6760 GGCTCCGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTTGCAGTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GATGGCAGCT Messenger 336261 (GAM336261) oligonucleotides modulates expression of respective target

GGAGGTGGAG genes whose function and utility is known in the art.

CAACCTGATG GAM336261 is a novel bioinformatically detectable regulatory, non protein

TCGTGGTTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336261 was detected

GCATCCACGA is described with additional reference to Figs. 9-15.

CAGCTTCTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGACAAGTG encoded by the human genome.

ATCCTAGCC GAM336261 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336261 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336261 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336261 precursor RNA is designated SEQ ID:6760, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6760 is located from position 2004805 to position 2004903 relative to chromosome 10 on the `+` strand.

GAM336261 precursor RNA folds onto itself, forming GAM336261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336261 precursor RNA, designated SEQ ID NO: 6760, and a schematic representation of a predicted secondary folding of GAM336261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336261 folded precursor RNA yielding a GAM336261 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336261 RNA, hereby incorporated herein.

GAM336261 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336261 target RNA, herein designated GAM TARGET RNA.

GAM336261 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336261 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336261 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336261 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336261 RNA, herein designated GAM RNA, to target binding sites on GAM336261 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336261 target RNA into GAM336261 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336261 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336261 target genes. The mRNA of each one of this plurality of GAM336261 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336261 RNA, herein designated GAM RNA, and which when bound by GAM336261 RNA causes inhibition of translation of the GAM336261 target mRNA into a corresponding GAM336261 target protein.

The mechanism of the translational inhibition exerted by GAM336261 RNA, herein designated GAM RNA, on one or more GAM336261 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336261 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336261 RNA, herein designated GAM RNA, of GAM336261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336261 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336261 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336261 RNA correlate with, and may be deduced from, the identity of the GAM336261 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336264 6970 TAGGAATGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGGTTGTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGGTAGGCT Messenger 336264 (GAM336264) oligonucleotides modulates expression of respective target
TGGGAGCCAG genes whose function and utility is known in the art.

GCTGCCCTGA GAM336264 is a novel bioinformatically detectable regulatory, non protein
ACTCTGGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336264 was detected
TCCACACTTC is described with additional reference to Figs. 9-15.

TA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336264 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336264 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336264 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336264 precursor RNA is designated SEQ ID:6970, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6970 is located from position 2764962 to position 2765033 relative to chromosome 20 on the `+` strand.

GAM336264 precursor RNA folds onto itself, forming GAM336264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336264 precursor RNA, designated SEQ ID NO: 6970, and a schematic representation of a predicted secondary folding of GAM336264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336264 folded precursor RNA yielding a GAM336264 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336264 RNA, hereby incorporated herein.

GAM336264 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336264 target RNA, herein designated GAM TARGET RNA.

GAM336264 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336264 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336264 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336264 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336264 RNA, herein designated GAM RNA, to target binding sites on GAM336264 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336264 target RNA into GAM336264 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336264 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336264 target genes. The mRNA of each one of this plurality of GAM336264 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336264 RNA, herein designated GAM RNA, and which when bound by GAM336264 RNA causes inhibition of translation of the GAM336264 target mRNA into a corresponding GAM336264 target protein.

The mechanism of the translational inhibition exerted by GAM336264 RNA, herein designated GAM RNA, on one or more GAM336264 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336264 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336264 RNA, herein designated GAM RNA, of GAM336264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336264 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336264 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336264 RNA correlate with, and may be deduced from, the identity of the GAM336264 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336267 6293 GAAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAATCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address
AAGGTGGAGG Messenger 336267 (GAM336267) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM336267 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336267 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

CGACAGAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGACTCCGTC encoded by the human genome.

GAM336267 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336267 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336267 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336267 precursor RNA is designated SEQ ID:6293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6293 is located from position 2999427 to position 2999516 relative to chromosome 19 on the `+` strand.

GAM336267 precursor RNA folds onto itself, forming GAM336267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336267 precursor RNA, designated SEQ ID NO: 6293, and a schematic representation of a predicted secondary folding of GAM336267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336267 folded precursor RNA yielding a GAM336267 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336267 RNA, hereby incorporated herein.

GAM336267 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336267 target RNA, herein designated GAM TARGET RNA.

GAM336267 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336267 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336267 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336267 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336267 RNA, herein designated GAM RNA, to target binding sites on GAM336267 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336267 target RNA into GAM336267 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336267 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336267 target genes. The mRNA of each one of this plurality of GAM336267 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336267 RNA, herein designated GAM RNA, and which when bound by GAM336267 RNA causes inhibition of translation of the GAM336267 target mRNA into a corresponding GAM336267 target protein.

The mechanism of the translational inhibition exerted by GAM336267 RNA, herein designated GAM RNA, on one or more GAM336267 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336267 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336267 RNA, herein designated GAM RNA, of GAM336267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336267 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336267 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336267 RNA correlate with, and may be deduced from, the identity of the GAM336267 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336270 5995 CACCCGTGCC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGGATTCTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TAAGACAAAG Messenger 336270 (GAM336270) oligonucleotides modulates expression of respective target
GAGAAGTCTT genes whose function and utility is known in the art.

AAAGCCTTAC GAM336270 is a novel bioinformatically detectable regulatory, non protein
AGCGTCTTAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336270 was detected
GTCTTAGATC is described with additional reference to Figs. 9-15.

ACATTTAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGACCCGGTA encoded by the human genome.

CAGGTG GAM336270 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336270 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336270 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336270 precursor RNA is designated SEQ ID:5995, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5995 is located from position 3269951 to position 3270046 relative to chromosome 10 on the `+` strand.

GAM336270 precursor RNA folds onto itself, forming GAM336270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336270 precursor RNA, designated SEQ ID NO: 5995, and a schematic representation of a predicted secondary folding of GAM336270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336270 folded precursor RNA yielding a GAM336270 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336270 RNA, hereby incorporated herein.

GAM336270 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336270 target RNA, herein designated GAM TARGET RNA.

GAM336270 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336270 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336270 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336270 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336270 RNA, herein designated GAM RNA, to target binding sites on GAM336270 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336270 target RNA into GAM336270 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336270 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336270 target genes. The mRNA of each one of this plurality of GAM336270 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336270 RNA, herein designated GAM RNA, and which when bound by GAM336270 RNA causes inhibition of translation of the GAM336270 target mRNA into a corresponding GAM336270 target protein.

The mechanism of the translational inhibition exerted by GAM336270 RNA, herein designated GAM RNA, on one or more GAM336270 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336270 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336270 RNA, herein designated GAM RNA, of GAM336270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336270 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336270 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336270 RNA correlate with, and may be deduced from, the identity of the GAM336270 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336271 5776 AGGCGCTAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTAAGGCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCTGGGAAG Messenger 336271 (GAM336271) oligonucleotides modulates expression of respective target

AGCTGTTAAG genes whose function and utility is known in the art.

ATTAGACTGT GAM336271 is a novel bioinformatically detectable regulatory, non protein

TCTCCCAAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336271 was detected

AGCCAATAAT is described with additional reference to Figs. 9-15.

TCTGAGTGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

T encoded by the human genome.

GAM336271 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336271 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336271 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336271 precursor RNA is designated SEQ ID:5776, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5776 is located from position 3307949 to position 3308029 relative to chromosome 12 on the `+` strand.

GAM336271 precursor RNA folds onto itself, forming GAM336271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336271 precursor RNA, designated SEQ ID NO: 5776, and a schematic representation of a predicted secondary folding of GAM336271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336271 folded precursor RNA yielding a GAM336271 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336271 RNA, hereby incorporated herein.

GAM336271 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336271 target RNA, herein designated GAM TARGET RNA.

GAM336271 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336271 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336271 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336271 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336271 RNA, herein designated GAM RNA, to target binding sites on GAM336271 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336271 target RNA into GAM336271 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336271 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336271 target genes. The mRNA of each one of this plurality of GAM336271 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336271 RNA, herein designated GAM RNA, and which when bound by GAM336271 RNA causes inhibition of translation of the GAM336271 target mRNA into a corresponding GAM336271 target protein.

The mechanism of the translational inhibition exerted by GAM336271 RNA, herein designated GAM RNA, on one or more GAM336271 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336271 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336271 RNA, herein designated GAM RNA, of GAM336271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336271 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336271 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336271 RNA correlate with, and may be deduced from, the identity of the GAM336271 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336272 7249 TGGTAGGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAGATGTCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTCAGAATCT Messenger 336272 (GAM336272) oligonucleotides modulates expression of respective target

TTTGTCTCTG genes whose function and utility is known in the art.

AGAAGATGCC GAM336272 is a novel bioinformatically detectable regulatory, non protein

TAGAGAAAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336272 was detected

GGAATTCAAT is described with additional reference to Figs. 9-15.

AGGATAAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCATTCTCCA encoded by the human genome.

GATTCACATT GAM336272 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TATTTTCCTA GAM336272 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

CCA GAM336272 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336272 precursor RNA is designated SEQ ID:7249, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7249 is located from position 3477981 to position 3478093

relative to chromosome 12 on the `+` strand.

GAM336272 precursor RNA folds onto itself, forming GAM336272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336272 precursor RNA, designated SEQ ID NO: 7249, and a schematic representation of a predicted secondary folding of GAM336272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336272 folded precursor RNA yielding a GAM336272 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336272 RNA, hereby incorporated herein.

GAM336272 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336272 target RNA, herein designated GAM TARGET RNA.

GAM336272 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336272 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336272 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336272 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336272 RNA, herein designated GAM RNA, to target binding sites on GAM336272 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336272 target RNA into GAM336272 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336272 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336272 target genes. The mRNA of each one of this plurality of GAM336272 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336272 RNA, herein designated GAM RNA, and which when bound by GAM336272 RNA causes inhibition of translation of the GAM336272 target mRNA into a corresponding GAM336272 target protein.

The mechanism of the translational inhibition exerted by GAM336272 RNA, herein designated GAM RNA, on one or more GAM336272 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336272 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336272 RNA, herein designated GAM RNA, of GAM336272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336272 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336272 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336272 RNA correlate with, and may be deduced from, the identity of the GAM336272 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336275 7328 TTGCTTTCTA Fig. 8 further provides a conceptual description of another novel bioinformatically

AACCTGTAGT genes whose function and utility is known in the art.

CAGTCATTTG GAM336275 is a novel bioinformatically detectable regulatory, non protein
CCTCAGGTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336275 was detected
ACCTGCCAGT is described with additional reference to Figs. 9-15.

CCCACCAGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAAAGCAA encoded by the human genome.

GAM336275 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336275 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336275 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336275 precursor RNA is designated SEQ ID:7328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7328 is located from position 3861125 to position 3861212 relative to chromosome 12 on the `-` strand.

GAM336275 precursor RNA folds onto itself, forming GAM336275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336275 precursor RNA, designated SEQ ID NO: 7328, and a schematic representation of a predicted secondary folding of GAM336275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336275 folded precursor RNA yielding a GAM336275 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336275 RNA, hereby incorporated herein.

GAM336275 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336275 target RNA, herein designated GAM TARGET RNA.

GAM336275 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336275 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336275 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336275 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336275 RNA, herein designated GAM RNA, to target

binding sites on GAM336275 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336275 target RNA into GAM336275 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336275 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336275 target genes. The mRNA of each one of this plurality of GAM336275 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336275 RNA, herein designated GAM RNA, and which when bound by GAM336275 RNA causes inhibition of translation of the GAM336275 target mRNA into a corresponding GAM336275 target protein.

The mechanism of the translational inhibition exerted by GAM336275 RNA, herein designated GAM RNA, on one or more GAM336275 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336275 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336275 RNA, herein designated GAM RNA, of GAM336275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336275 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336275 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336275 RNA correlate with, and may be deduced from, the identity of the GAM336275 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336279 7067 TCTCTGAGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTGCTGCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCTTGTGTA Messenger 336279 (GAM336279) oligonucleotides modulates expression of respective target

ACAAAATGAA genes whose function and utility is known in the art.

TAATACCTGC GAM336279 is a novel bioinformatically detectable regulatory, non protein

CCTGAGGGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336279 was detected

TATGGCAGGT is described with additional reference to Figs. 9-15.

AAAGGAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCAGGCAGAG encoded by the human genome.

GTTGCAGAGG GAM336279 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336279 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336279 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336279 precursor RNA is designated SEQ ID:7067, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7067 is located from position 4367585 to position 4367684 relative to chromosome 17 on the `+` strand.

GAM336279 precursor RNA folds onto itself, forming GAM336279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336279 precursor RNA, designated SEQ ID NO: 7067, and a schematic representation of a predicted secondary folding of GAM336279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336279 folded precursor RNA yielding a GAM336279 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336279 RNA, hereby incorporated herein.

GAM336279 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336279 target RNA, herein designated GAM TARGET RNA.

GAM336279 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336279 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336279 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336279 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336279 RNA, herein designated GAM RNA, to target binding sites on GAM336279 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336279 target RNA into GAM336279 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336279 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336279 target genes. The mRNA of each one of this plurality of GAM336279 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336279 RNA, herein designated GAM RNA, and which when bound by GAM336279 RNA causes inhibition of translation of the GAM336279 target mRNA into a corresponding GAM336279 target protein.

The mechanism of the translational inhibition exerted by GAM336279 RNA, herein designated GAM RNA, on one or more GAM336279 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336279 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336279 RNA, herein designated GAM RNA, of GAM336279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336279 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336279 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336279 RNA correlate with, and may be deduced from, the identity of the GAM336279 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336281 5832 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336281 (GAM336281) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336281 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336281 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336281 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336281 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336281 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336281 precursor RNA is designated SEQ ID:5832, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5832 is located from position 4437001 to position 4437082 relative to chromosome 6 on the `+` strand.

GAM336281 precursor RNA folds onto itself, forming GAM336281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336281 precursor RNA, designated SEQ ID NO: 5832, and a schematic representation of a predicted secondary folding of GAM336281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336281 folded precursor RNA yielding a GAM336281 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336281 RNA, hereby incorporated herein.

GAM336281 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336281 target RNA, herein designated GAM TARGET RNA.

GAM336281 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336281 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336281 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336281 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336281 RNA, herein designated GAM RNA, to target binding sites on GAM336281 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336281 target RNA into GAM336281 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336281 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336281 target genes. The mRNA of each one of this plurality of GAM336281 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336281 RNA, herein designated GAM RNA, and which when bound by GAM336281 RNA causes inhibition of translation of the GAM336281 target mRNA into a corresponding GAM336281 target protein.

The mechanism of the translational inhibition exerted by GAM336281 RNA, herein designated GAM RNA, on one or more GAM336281 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336281 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336281 RNA, herein designated GAM RNA, of GAM336281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336281 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336281 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336281

RNA correlate with, and may be deduced from, the identity of the GAM336281 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336282 6012 CAGAGTCTCG Fig. 8 further provides a conceptual description of another novel bioinformatically
CTCTGTTGCT detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGGCTGGAG Messenger 336282 (GAM336282) oligonucleotides modulates expression of respective target
TGCAGTGGTG genes whose function and utility is known in the art.

CAATCTTGGC GAM336282 is a novel bioinformatically detectable regulatory, non protein
TCACTGCAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336282 was detected
CTCCATCTCC is described with additional reference to Figs. 9-15.

TGGGTTTAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGATTCTCAT encoded by the human genome.

G GAM336282 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336282 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336282 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336282 precursor RNA is designated SEQ ID:6012, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6012 is located from position 4444093 to position 4444183 relative to chromosome 17 on the `+` strand.

GAM336282 precursor RNA folds onto itself, forming GAM336282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336282 precursor RNA, designated SEQ ID NO: 6012, and a schematic representation of a predicted secondary folding of GAM336282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336282 folded precursor RNA yielding a GAM336282 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336282 RNA, hereby incorporated herein.

GAM336282 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336282 target RNA, herein designated GAM TARGET RNA.

GAM336282 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336282 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336282 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336282 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336282 RNA, herein designated GAM RNA, to target binding sites on GAM336282 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336282 target RNA into GAM336282 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336282 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336282 target genes. The mRNA of each one of this plurality of GAM336282 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336282 RNA, herein designated GAM RNA, and which when bound by GAM336282 RNA causes inhibition of translation of the GAM336282 target mRNA into a corresponding GAM336282 target protein.

The mechanism of the translational inhibition exerted by GAM336282 RNA, herein designated GAM RNA, on one or more GAM336282 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336282 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336282 RNA, herein designated GAM RNA, of GAM336282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336282 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336282 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336282 RNA correlate with, and may be deduced from, the identity of the GAM336282 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336283 6464 GAGTCTCGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTGGAGTG Messenger 336283 (GAM336283) oligonucleotides modulates expression of respective target
CAGTGGTGCA genes whose function and utility is known in the art.

ATCTTGGCTC GAM336283 is a novel bioinformatically detectable regulatory, non protein
ACTGCAACCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336283 was detected
CCATCTCCTG is described with additional reference to Figs. 9-15.

GGTTTAAGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTCTC encoded by the human genome.

GAM336283 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336283 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336283 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336283 precursor RNA is designated SEQ ID:6464, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6464 is located from position 4444095 to position 4444180 relative to chromosome 17 on the `+` strand.

GAM336283 precursor RNA folds onto itself, forming GAM336283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336283 precursor RNA, designated SEQ ID NO: 6464, and a schematic representation of a predicted secondary folding of GAM336283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336283 folded precursor RNA yielding a GAM336283 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336283 RNA, hereby incorporated herein.

GAM336283 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336283 target RNA, herein designated GAM TARGET RNA.

GAM336283 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336283 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336283 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336283 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336283 RNA, herein designated GAM RNA, to target binding sites on GAM336283 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336283 target RNA into GAM336283 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336283 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336283 target genes. The mRNA of each one of this plurality of GAM336283 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336283 RNA, herein designated GAM RNA, and which when bound by GAM336283 RNA causes inhibition of translation of the GAM336283 target mRNA into a corresponding GAM336283 target protein.

The mechanism of the translational inhibition exerted by GAM336283 RNA, herein designated GAM RNA, on one or more GAM336283 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336283 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336283 RNA, herein designated GAM RNA, of GAM336283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336283 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336283 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336283 RNA correlate with, and may be deduced from, the identity of the GAM336283 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336284 5833 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TATGTATACA GAM336284 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336284 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336284 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336284 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336284 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336284 precursor RNA is designated SEQ ID:5833, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5833 is located from position 4649605 to position 4649686 relative to chromosome 6 on the `+` strand.

GAM336284 precursor RNA folds onto itself, forming GAM336284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336284 precursor RNA, designated SEQ ID NO: 5833, and a schematic representation of a predicted secondary folding of GAM336284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336284 folded precursor RNA yielding a GAM336284 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336284 RNA, hereby incorporated herein.

GAM336284 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336284 target RNA, herein designated GAM TARGET RNA.

GAM336284 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336284 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336284 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336284 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336284 RNA, herein designated GAM RNA, to target binding sites on GAM336284 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336284 target RNA into GAM336284 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336284 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336284 target genes. The mRNA of each one of this plurality of GAM336284 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336284 RNA, herein designated GAM RNA, and which when bound by GAM336284 RNA causes inhibition of translation of the GAM336284 target mRNA into a corresponding GAM336284 target protein.

The mechanism of the translational inhibition exerted by GAM336284 RNA, herein designated GAM RNA, on one or more GAM336284 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336284 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336284 RNA, herein designated GAM RNA, of GAM336284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336284 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336284 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336284 RNA correlate with, and may be deduced from, the identity of the GAM336284 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336285 5834 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336285 (GAM336285) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336285 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336285 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336285 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336285 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336285 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336285 precursor RNA is designated SEQ ID:5834, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5834 is located from position 4756826 to position 4756907 relative to chromosome 18 on the `-` strand.

GAM336285 precursor RNA folds onto itself, forming GAM336285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336285 precursor RNA, designated SEQ ID NO: 5834, and a schematic representation of a predicted secondary folding of GAM336285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336285 folded precursor RNA yielding a GAM336285 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336285 RNA, hereby incorporated herein.

GAM336285 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336285 target RNA, herein designated GAM TARGET RNA.

GAM336285 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336285 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336285 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336285 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336285 RNA, herein designated GAM RNA, to target binding sites on GAM336285 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336285 target RNA into GAM336285 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336285 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336285 target genes. The mRNA of each one of this

plurality of GAM336285 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336285 RNA, herein designated GAM RNA, and which when bound by GAM336285 RNA causes inhibition of translation of the GAM336285 target mRNA into a corresponding GAM336285 target protein.

The mechanism of the translational inhibition exerted by GAM336285 RNA, herein designated GAM RNA, on one or more GAM336285 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336285 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336285 RNA, herein designated GAM RNA, of GAM336285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336285 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336285 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336285 RNA correlate with, and may be deduced from, the identity of the GAM336285 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336289 7076 TCTGTGGTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGGAATGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGGAAGTGTG Messenger 336289 (GAM336289) oligonucleotides modulates expression of respective target

TGAGCTAGAT genes whose function and utility is known in the art.

TGCACAGATA GAM336289 is a novel bioinformatically detectable regulatory, non protein

GCAAGCAGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336289 was detected

CATTTCTGGT is described with additional reference to Figs. 9-15.

GAACTTGGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACACAGA encoded by the human genome.

GAM336289 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336289 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336289 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336289 precursor RNA is designated SEQ ID:7076, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7076 is located from position 5537268 to position 5537354 relative to chromosome 11 on the `+` strand.

GAM336289 precursor RNA folds onto itself, forming GAM336289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336289 precursor RNA, designated SEQ ID NO: 7076, and a schematic representation of a predicted secondary folding of GAM336289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336289 folded precursor RNA yielding a GAM336289 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336289 RNA, hereby incorporated herein.

GAM336289 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336289 target RNA, herein designated GAM TARGET RNA.

GAM336289 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336289 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336289 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336289 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336289 RNA, herein designated GAM RNA, to target binding sites on GAM336289 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336289 target RNA into GAM336289 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336289 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336289 target genes. The mRNA of each one of this plurality of GAM336289 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336289 RNA, herein designated GAM RNA, and which when bound by GAM336289 RNA causes inhibition of translation of the GAM336289 target mRNA into a corresponding GAM336289 target protein.

The mechanism of the translational inhibition exerted by GAM336289 RNA, herein designated GAM RNA, on one or more GAM336289 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336289 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336289 RNA, herein designated GAM RNA, of GAM336289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336289 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336289 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336289 RNA correlate with, and may be deduced from, the identity of the GAM336289 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336290 6245 CTGTGGTTGA Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGAATGGAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GGAAGTGTGT Messenger 336290 (GAM336290) oligonucleotides modulates expression of respective target
GAGCTAGATT genes whose function and utility is known in the art.

GCACAGATAG GAM336290 is a novel bioinformatically detectable regulatory, non protein
CAAGCAGAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336290 was detected
ATTTCTGGTG is described with additional reference to Figs. 9-15.

AACTTGGACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CACAG encoded by the human genome.

GAM336290 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336290 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336290 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336290 precursor RNA is designated SEQ ID:6245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6245 is located from position 5537269 to position 5537353 relative to chromosome 11 on the `+` strand.

GAM336290 precursor RNA folds onto itself, forming GAM336290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336290 precursor RNA, designated SEQ ID NO: 6245, and a schematic representation of a predicted secondary folding of GAM336290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336290 folded precursor RNA yielding a GAM336290 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336290 RNA, hereby incorporated herein.

GAM336290 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336290 target RNA, herein designated GAM TARGET RNA.

GAM336290 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336290 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336290 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336290 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336290 RNA, herein designated GAM RNA, to target binding sites on GAM336290 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336290 target RNA into GAM336290 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336290 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336290 target genes. The mRNA of each one of this plurality of GAM336290 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336290 RNA, herein designated GAM RNA, and which when bound by GAM336290 RNA causes inhibition of translation of the GAM336290 target mRNA into a corresponding GAM336290 target protein.

The mechanism of the translational inhibition exerted by GAM336290 RNA, herein designated GAM RNA, on one or more GAM336290 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336290 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336290 RNA, herein designated GAM RNA, of GAM336290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336290 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336290 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336290 RNA correlate with, and may be deduced from, the identity of the GAM336290 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336291 6149 CGTCTAGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAATGAGCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTAGTCCTT Messenger 336291 (GAM336291) oligonucleotides modulates expression of respective target

TAGAGCCTCT genes whose function and utility is known in the art.

GGACAGAAGG GAM336291 is a novel bioinformatically detectable regulatory, non protein
TAATGCTCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336291 was detected
AATCCAGTGA is described with additional reference to Figs. 9-15.

TTCTCGAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAATGGAG encoded by the human genome.

GATTTGCACT GAM336291 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AGATG GAM336291 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336291 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336291 precursor RNA is designated SEQ ID:6149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6149 is located from position 5605037 to position 5605141 relative to chromosome 11 on the `-` strand.

GAM336291 precursor RNA folds onto itself, forming GAM336291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336291 precursor RNA, designated SEQ ID NO: 6149, and a schematic representation of a predicted secondary folding of GAM336291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336291 folded precursor RNA yielding a GAM336291 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336291 RNA, hereby incorporated herein.

GAM336291 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336291 target RNA, herein designated GAM TARGET RNA.

GAM336291 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336291 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336291 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336291 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336291 RNA, herein designated GAM RNA, to target binding sites on GAM336291 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336291 target RNA into GAM336291 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336291 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336291 target genes. The mRNA of each one of this plurality of GAM336291 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336291 RNA, herein designated GAM RNA, and which when bound by GAM336291 RNA causes inhibition of translation of the GAM336291 target mRNA into a corresponding GAM336291 target protein.

The mechanism of the translational inhibition exerted by GAM336291 RNA, herein designated GAM RNA, on one or more GAM336291 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336291 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336291 RNA, herein designated GAM RNA, of GAM336291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336291 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336291 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336291 RNA correlate with, and may be deduced from, the identity of the GAM336291 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336292 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336292 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336292 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336292 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336292 precursor RNA is designated SEQ ID:5835, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5835 is located from position 5676458 to position 5676539 relative to chromosome 6 on the `+` strand.

GAM336292 precursor RNA folds onto itself, forming GAM336292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336292 precursor RNA, designated SEQ ID NO: 5835, and a schematic representation of a predicted secondary folding of GAM336292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336292 folded precursor RNA yielding a GAM336292 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336292 RNA, hereby incorporated herein.

GAM336292 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336292 target RNA, herein designated GAM TARGET RNA.

GAM336292 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336292 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336292 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336292 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336292 RNA, herein designated GAM RNA, to target binding sites on GAM336292 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336292 target RNA into GAM336292 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336292 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336292 target genes. The mRNA of each one of this plurality of GAM336292 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336292 RNA, herein designated GAM RNA, and which when bound by GAM336292 RNA causes inhibition of translation of the GAM336292 target mRNA into a corresponding GAM336292 target protein.

The mechanism of the translational inhibition exerted by GAM336292 RNA, herein designated GAM RNA, on one or more GAM336292 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336292 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336292 RNA, herein designated GAM RNA, of GAM336292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336292 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336292 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336292 RNA correlate with, and may be deduced from, the identity of the GAM336292 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTGCTGTTAA is described with additional reference to Figs. 9-15.

GAAGCAGAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTTCCCCTA encoded by the human genome.

AGCCC GAM336293 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336293 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336293 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336293 precursor RNA is designated SEQ ID:6823, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6823 is located from position 5710623 to position 5710717 relative to chromosome 17 on the `+` strand.

GAM336293 precursor RNA folds onto itself, forming GAM336293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336293 precursor RNA, designated SEQ ID NO: 6823, and a schematic representation of a predicted secondary folding of GAM336293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336293 folded precursor

RNA yielding a GAM336293 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336293 RNA, hereby incorporated herein.

GAM336293 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336293 target RNA, herein designated GAM TARGET RNA.

GAM336293 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336293 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336293 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336293 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336293 RNA, herein designated GAM RNA, to target binding sites on GAM336293 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336293 target RNA into GAM336293 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336293 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336293 target genes. The mRNA of each one of this plurality of GAM336293 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336293 RNA, herein designated GAM RNA, and which when bound by GAM336293 RNA causes inhibition of translation of the GAM336293 target mRNA into a corresponding GAM336293 target protein.

The mechanism of the translational inhibition exerted by GAM336293 RNA, herein designated GAM RNA, on one or more GAM336293 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336293 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336293 RNA, herein designated GAM RNA, of GAM336293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336293 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336293 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336293 RNA correlate with, and may be deduced from, the identity of the GAM336293 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336294 6861 GTAGAGATGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTTTTACTA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTTGCCCAG Messenger 336294 (GAM336294) oligonucleotides modulates expression of respective target

GTTGATCTTG genes whose function and utility is known in the art.

AACTCCTGGG GAM336294 is a novel bioinformatically detectable regulatory, non protein

CTCAAGTGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336294 was detected

CCTCCCATCT is described with additional reference to Figs. 9-15.

TGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336294 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336294 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336294 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336294 precursor RNA is designated SEQ ID:6861, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6861 is located from position 5786960 to position 5787033 relative to chromosome 7 on the `-` strand.

GAM336294 precursor RNA folds onto itself, forming GAM336294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336294 precursor RNA, designated SEQ ID NO: 6861, and a schematic representation of a predicted secondary folding of GAM336294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336294 folded precursor RNA yielding a GAM336294 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336294 RNA, hereby incorporated herein.

GAM336294 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336294 target RNA, herein designated GAM TARGET RNA.

GAM336294 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336294 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336294 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336294 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336294 RNA, herein designated GAM RNA, to target binding sites on GAM336294 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336294 target RNA into GAM336294 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336294 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336294 target genes. The mRNA of each one of this plurality of GAM336294 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336294 RNA, herein designated GAM RNA, and which when bound by GAM336294 RNA causes inhibition of translation of the GAM336294 target mRNA into a corresponding GAM336294 target protein.

The mechanism of the translational inhibition exerted by GAM336294 RNA, herein designated GAM RNA, on one or more GAM336294 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336294 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336294 RNA, herein designated GAM RNA, of GAM336294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336294 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336294 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336294 RNA correlate with, and may be deduced from, the identity of the GAM336294 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336297 7104 TGAGATGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTTGCTCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTGCCCAGG Messenger 336297 (GAM336297) oligonucleotides modulates expression of respective target

CTGTAGTGTA genes whose function and utility is known in the art.

ATGTAGTGCA GAM336297 is a novel bioinformatically detectable regulatory, non protein

ATCTTGGCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336297 was detected

AGTACAACCT is described with additional reference to Figs. 9-15.

CTGCCTCCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTTCAAGCC encoded by the human genome.

ATTCTCCTGC GAM336297 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTCA GAM336297 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336297 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336297 precursor RNA is designated SEQ ID:7104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7104 is located from position 6079591 to position 6079694 relative to chromosome 10 on the `+` strand.

GAM336297 precursor RNA folds onto itself, forming GAM336297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336297 precursor RNA, designated SEQ ID NO: 7104, and a schematic representation of a predicted secondary folding of GAM336297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336297 folded precursor RNA yielding a GAM336297 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336297 RNA, hereby incorporated herein.

GAM336297 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336297 target RNA, herein designated GAM TARGET RNA.

GAM336297 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336297 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336297 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336297 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336297 RNA, herein designated GAM RNA, to target binding sites on GAM336297 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336297 target RNA into GAM336297 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336297 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336297 target genes. The mRNA of each one of this

plurality of GAM336297 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336297 RNA, herein designated GAM RNA, and which when bound by GAM336297 RNA causes inhibition of translation of the GAM336297 target mRNA into a corresponding GAM336297 target protein.

The mechanism of the translational inhibition exerted by GAM336297 RNA, herein designated GAM RNA, on one or more GAM336297 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336297 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336297 RNA, herein designated GAM RNA, of GAM336297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336297 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336297 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336297 RNA correlate with, and may be deduced from, the identity of the GAM336297 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336298 6354 GAGATGGAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCCCAGGC Messenger 336298 (GAM336298) oligonucleotides modulates expression of respective target
TGTAGTGTAA genes whose function and utility is known in the art.

TGTAGTGCAA GAM336298 is a novel bioinformatically detectable regulatory, non protein
TCTTGGCTTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336298 was detected
GTACAACCTC is described with additional reference to Figs. 9-15.

TGCCTCCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTTCAAGCCA encoded by the human genome.

TTCTCCTGCC GAM336298 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TC GAM336298 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336298 precursor RNA is designated SEQ ID:6354, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6354 is located from position 6079592 to position 6079693 relative to chromosome 10 on the `+` strand.

GAM336298 precursor RNA folds onto itself, forming GAM336298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336298 precursor RNA, designated SEQ ID NO: 6354, and a schematic representation of a predicted secondary folding of GAM336298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336298 folded precursor RNA yielding a GAM336298 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336298 RNA, hereby incorporated herein.

GAM336298 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336298 target RNA, herein designated GAM TARGET RNA.

GAM336298 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336298 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336298 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336298 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336298 RNA, herein designated GAM RNA, to target binding sites on GAM336298 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336298 target RNA into GAM336298 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336298 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336298 target genes. The mRNA of each one of this plurality of GAM336298 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336298 RNA, herein designated GAM RNA, and which when bound by GAM336298 RNA causes inhibition of translation of the GAM336298 target mRNA into a corresponding GAM336298 target protein.

The mechanism of the translational inhibition exerted by GAM336298 RNA, herein designated GAM RNA, on one or more GAM336298 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336298 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336298 RNA, herein designated GAM RNA, of GAM336298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336298 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336298 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336298 RNA correlate with, and may be deduced from, the identity of the GAM336298 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336299 6842 GGTGACAAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGCTATCAG GAM336299 is a novel bioinformatically detectable regulatory, non protein
AGCTTACTAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336299 was detected
AACTTTAAAC is described with additional reference to Figs. 9-15.

TTCTGGGCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGGTGATCCT encoded by the human genome.

CCCACC GAM336299 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336299 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336299 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336299 precursor RNA is designated SEQ ID:6842, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6842 is located from position 6225060 to position 6225155 relative to chromosome 9 on the `+` strand.

GAM336299 precursor RNA folds onto itself, forming GAM336299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336299 precursor RNA, designated SEQ ID NO: 6842, and a schematic representation of a predicted secondary folding of GAM336299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336299 folded precursor RNA yielding a GAM336299 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336299 RNA, hereby incorporated herein.

GAM336299 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336299 target RNA, herein designated GAM TARGET RNA.

GAM336299 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336299 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336299 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336299 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336299 RNA, herein designated GAM RNA, to target binding sites on GAM336299 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336299 target RNA into GAM336299 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336299 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336299 target genes. The mRNA of each one of this plurality of GAM336299 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336299 RNA, herein designated GAM RNA, and which when bound by GAM336299 RNA causes inhibition of translation of the GAM336299 target mRNA into a corresponding GAM336299 target protein.

The mechanism of the translational inhibition exerted by GAM336299 RNA, herein designated GAM RNA, on one or more GAM336299 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336299 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336299 RNA, herein designated GAM RNA, of GAM336299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336299 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336299 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336299 RNA correlate with, and may be deduced from, the identity of the GAM336299 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336300 6995 TCACTCTGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCCAGACTG detected oligonucleotides of the present invention, referred to here as Genomic Address

CTATCAGAGC genes whose function and utility is known in the art.

TTACTACAAC GAM336300 is a novel bioinformatically detectable regulatory, non protein

TTTAAACTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336300 was detected

TGGGCTCAGG is described with additional reference to Figs. 9-15.

TGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336300 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336300 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336300 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336300 precursor RNA is designated SEQ ID:6995, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6995 is located from position 6225073 to position 6225145 relative to chromosome 9 on the `+` strand.

GAM336300 precursor RNA folds onto itself, forming GAM336300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336300 precursor RNA, designated SEQ ID NO: 6995, and a schematic representation of a predicted secondary folding of GAM336300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336300 folded precursor RNA yielding a GAM336300 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336300 RNA, hereby incorporated herein.

GAM336300 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336300 target RNA, herein designated GAM TARGET RNA.

GAM336300 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336300 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336300 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336300 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336300 RNA, herein designated GAM RNA, to target binding sites on GAM336300 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336300 target RNA into GAM336300 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336300 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336300 target genes. The mRNA of each one of this plurality of GAM336300 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336300 RNA, herein designated GAM RNA, and which when bound by GAM336300 RNA causes inhibition of translation of the GAM336300 target mRNA into a corresponding GAM336300 target protein.

The mechanism of the translational inhibition exerted by GAM336300 RNA, herein designated GAM RNA, on one or more GAM336300 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336300 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336300 RNA, herein designated GAM RNA, of GAM336300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336300 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336300 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336300 RNA correlate with, and may be deduced from, the identity of the GAM336300 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336303 5777 AGGCGTGAGA Fig. 8 further provides a conceptual description of another novel bioinformatically
ATCGCTTGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
CCTGGAAGGT Messenger 336303 (GAM336303) oligonucleotides modulates expression of respective target
GGTGGTTGCA genes whose function and utility is known in the art.

GTGAGCCGAG GAM336303 is a novel bioinformatically detectable regulatory, non protein
ATCCTGCCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336303 was detected
TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGCGAGAC encoded by the human genome.

TCTGCCT GAM336303 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336303 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336303 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336303 precursor RNA is designated SEQ ID:5777, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5777 is located from position 6623046 to position 6623142 relative to chromosome 17 on the `+` strand.

GAM336303 precursor RNA folds onto itself, forming GAM336303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336303 precursor RNA, designated SEQ ID NO: 5777, and a schematic representation of a predicted secondary folding of GAM336303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336303 folded precursor RNA yielding a GAM336303 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336303 RNA, hereby incorporated herein.

Expression of GAM336303 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336303 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336303 target RNA, herein designated GAM TARGET RNA.

GAM336303 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336303 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336303 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336303 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336303 RNA, herein designated GAM RNA, to target binding sites on GAM336303 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336303 target RNA into GAM336303 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336303 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336303 target genes. The mRNA of each one of this plurality of GAM336303 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336303 RNA, herein designated GAM RNA, and which when bound by GAM336303 RNA causes inhibition of translation of the GAM336303 target mRNA into a corresponding GAM336303 target protein.

The mechanism of the translational inhibition exerted by GAM336303 RNA, herein designated GAM RNA, on one or more GAM336303 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336303 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336303 RNA, herein designated GAM RNA, of GAM336303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336303 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336303 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336303 RNA correlate with, and may be deduced from, the identity of the GAM336303 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336304 6349 GAGACGTGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCGTTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCTGGGAGG Messenger 336304 (GAM336304) oligonucleotides modulates expression of respective target
TGGAGGTTGT genes whose function and utility is known in the art.

AGTGAGCCCA GAM336304 is a novel bioinformatically detectable regulatory, non protein
AATCATGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336304 was detected
CATGTCACTG is described with additional reference to Figs. 9-15.

CACTCCAGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAGGCAACAG encoded by the human genome.

AGCAAGACTC GAM336304 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TGTCTC GAM336304 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336304 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336304 precursor RNA is designated SEQ ID:6349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6349 is located from position 6644614 to position 6644719 relative to chromosome 12 on the `-` strand.

GAM336304 precursor RNA folds onto itself, forming GAM336304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336304 precursor RNA, designated SEQ ID NO: 6349, and a schematic representation of a predicted secondary folding of GAM336304 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336304 folded precursor RNA yielding a GAM336304 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336304 RNA, hereby incorporated herein.

GAM336304 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336304 target RNA, herein designated GAM TARGET RNA.

GAM336304 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336304 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336304 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336304 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336304 RNA, herein designated GAM RNA, to target binding sites on GAM336304 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336304 target RNA into GAM336304 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336304 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336304 target genes. The mRNA of each one of this plurality of GAM336304 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336304 RNA, herein designated GAM RNA, and which when bound by GAM336304 RNA causes inhibition of translation of the GAM336304 target mRNA into a corresponding GAM336304 target protein.

The mechanism of the translational inhibition exerted by GAM336304 RNA, herein designated GAM RNA, on one or more GAM336304 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336304 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336304 RNA, herein designated GAM RNA, of GAM336304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336304 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336304 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336304 RNA correlate with, and may be deduced from, the identity of the GAM336304 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCTGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336308 was detected

is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336308 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336308 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336308 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336308 precursor RNA is designated SEQ ID:5745, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5745 is located from position 6865733 to position 6865789 relative to chromosome 17 on the `-` strand.

GAM336308 precursor RNA folds onto itself, forming GAM336308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336308 precursor RNA, designated SEQ ID NO: 5745, and a schematic representation of a predicted secondary folding of GAM336308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336308 folded precursor RNA yielding a GAM336308 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336308 RNA, hereby incorporated herein.

GAM336308 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336308 target RNA, herein designated GAM TARGET RNA.

GAM336308 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336308 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336308 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336308 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336308 RNA, herein designated GAM RNA, to target binding sites on GAM336308 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336308 target RNA into GAM336308 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336308 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336308 target genes. The mRNA of each one of this plurality of GAM336308 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336308 RNA, herein designated GAM RNA, and which when bound by GAM336308 RNA causes inhibition of translation of the GAM336308 target mRNA into a corresponding GAM336308 target protein.

The mechanism of the translational inhibition exerted by GAM336308 RNA, herein designated GAM RNA, on one or more GAM336308 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336308 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336308 RNA, herein designated GAM RNA, of GAM336308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336308 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336308 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336308 RNA correlate with, and may be deduced from, the identity of the GAM336308 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336309 6881 GTCCTGGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACATGGTAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGAAGGAT Messenger 336309 (GAM336309) oligonucleotides modulates expression of respective target

CAGCCAACTT genes whose function and utility is known in the art.

TGAGACTCAG CTCTAGCTGC CTGTCTCCAG TGGC

GAM336309 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336309 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336309 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336309 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336309 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336309 precursor RNA is designated SEQ ID:6881, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6881 is located from position 6882641 to position 6882714 relative to chromosome 12 on the `+` strand.

GAM336309 precursor RNA folds onto itself, forming GAM336309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336309 precursor RNA, designated SEQ ID NO: 6881, and a schematic representation of a predicted secondary folding of GAM336309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336309 folded precursor RNA yielding a GAM336309 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336309 RNA, hereby incorporated herein.

GAM336309 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336309 target RNA, herein designated GAM TARGET RNA.

GAM336309 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336309 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336309 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336309 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336309 RNA, herein designated GAM RNA, to target binding sites on GAM336309 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336309 target RNA into GAM336309 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336309 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336309 target genes. The mRNA of each one of this plurality of GAM336309 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336309 RNA, herein designated GAM RNA, and which when bound by GAM336309 RNA causes inhibition of translation of the GAM336309 target mRNA into a corresponding GAM336309 target protein.

The mechanism of the translational inhibition exerted by GAM336309 RNA, herein designated GAM RNA, on one or more GAM336309 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336309 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336309 RNA, herein designated GAM RNA, of GAM336309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336309 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336309 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336309 RNA correlate with, and may be deduced from, the identity of the GAM336309 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336311 6414 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATTGCTTCA detected oligonucleotides of the present invention, referred to here as Genomic Address
AACTGGGCAG Messenger 336311 (GAM336311) oligonucleotides modulates expression of respective target
AGGTTGCAGT genes whose function and utility is known in the art.

GAGCCAAGGT GAM336311 is a novel bioinformatically detectable regulatory, non protein
TGACCCACTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336311 was detected
CACTCCAGCC is described with additional reference to Figs. 9-15.

TGGGCAACAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGCAAAACT encoded by the human genome.

CCATCTC GAM336311 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336311 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336311 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336311 precursor RNA is designated SEQ ID:6414, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6414 is located from position 7027442 to position 7027538 relative to chromosome 19 on the `+` strand.

GAM336311 precursor RNA folds onto itself, forming GAM336311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336311 precursor RNA, designated SEQ ID NO: 6414, and a schematic representation of a predicted secondary folding of GAM336311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336311 folded precursor RNA yielding a GAM336311 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336311 RNA, hereby incorporated herein. Expression of GAM336311 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336311 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336311 target RNA, herein designated GAM TARGET RNA.

GAM336311 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336311 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336311 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336311 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336311 RNA, herein designated GAM RNA, to target binding sites on GAM336311 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336311 target RNA into GAM336311 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336311 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336311 target genes. The mRNA of each one of this plurality of GAM336311 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336311 RNA, herein designated GAM RNA, and which when bound by GAM336311 RNA causes inhibition of translation of the GAM336311 target mRNA into a corresponding GAM336311 target protein.

The mechanism of the translational inhibition exerted by GAM336311 RNA, herein designated GAM RNA, on one or more GAM336311 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336311 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336311 RNA, herein designated GAM RNA, of GAM336311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336311 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336311 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336311 RNA correlate with, and may be deduced from, the identity of the GAM336311 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336313 6665 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAATCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTTGCAG Messenger 336313 (GAM336313) oligonucleotides modulates expression of respective target

TCACGCCACT GAM336313 is a novel bioinformatically detectable regulatory, non protein
GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336313 was detected
CTGGGTGACA is described with additional reference to Figs. 9-15.

GAGCAAGACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CC encoded by the human genome.

GAM336313 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336313 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336313 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336313 precursor RNA is designated SEQ ID:6665, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6665 is located from position 7192320 to position 7192401 relative to chromosome 19 on the `+` strand.

GAM336313 precursor RNA folds onto itself, forming GAM336313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336313 precursor RNA, designated SEQ ID NO: 6665, and a schematic representation of a predicted secondary folding of GAM336313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336313 folded precursor RNA yielding a GAM336313 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336313 RNA, hereby incorporated herein.

GAM336313 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336313 target RNA, herein designated GAM TARGET RNA.

GAM336313 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336313 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336313 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336313 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336313 RNA, herein designated GAM RNA, to target binding sites on GAM336313 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336313 target RNA into GAM336313 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336313 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336313 target genes. The mRNA of each one of this plurality of GAM336313 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336313 RNA, herein designated GAM RNA, and which when bound by GAM336313 RNA causes inhibition of translation of the GAM336313 target mRNA into a corresponding GAM336313 target protein.

The mechanism of the translational inhibition exerted by GAM336313 RNA, herein designated GAM RNA, on one or more GAM336313 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336313 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336313 RNA, herein designated GAM RNA, of GAM336313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336313 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336313 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336313 RNA correlate with, and may be deduced from, the identity of the GAM336313 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Expression of GAM336316 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336316 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336316 target RNA, herein designated GAM TARGET RNA.

GAM336316 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336316 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336316 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336316 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336316 RNA, herein designated GAM RNA, to target binding sites on GAM336316 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336316 target RNA into GAM336316 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336316 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336316 target genes. The mRNA of each one of this plurality of GAM336316 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336316 RNA, herein designated GAM RNA, and which when bound by GAM336316 RNA causes inhibition of translation of the GAM336316 target mRNA into a corresponding GAM336316 target protein.

The mechanism of the translational inhibition exerted by GAM336316 RNA, herein designated GAM RNA, on one or more GAM336316 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336316 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336316 RNA, herein designated GAM RNA, of GAM336316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336316 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336316 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336316 RNA correlate with, and may be deduced from, the identity of the GAM336316 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336317 6646 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCAGAGG Messenger 336317 (GAM336317) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

ATGAGATCAC GAM336317 is a novel bioinformatically detectable regulatory, non protein

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336317 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGAAACTCC encoded by the human genome.

GAM336317 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336317 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336317 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336317 precursor RNA is designated SEQ ID:6646, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6646 is located from position 7755718 to position 7755806 relative to chromosome 5 on the `+` strand.

GAM336317 precursor RNA folds onto itself, forming GAM336317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336317 precursor RNA, designated SEQ ID NO: 6646, and a schematic representation of a predicted secondary folding of GAM336317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336317 folded precursor RNA yielding a GAM336317 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336317 RNA, hereby incorporated herein. Expression of GAM336317 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336317 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336317 target RNA, herein designated GAM TARGET RNA.

GAM336317 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336317 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336317 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336317 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336317 RNA, herein designated GAM RNA, to target binding sites on GAM336317 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336317 target RNA into GAM336317 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336317 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336317 target genes. The mRNA of each one of this plurality of GAM336317 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336317 RNA, herein designated GAM RNA, and which when bound by GAM336317 RNA causes inhibition of translation of the GAM336317 target mRNA into a corresponding GAM336317 target protein.

The mechanism of the translational inhibition exerted by GAM336317 RNA, herein designated GAM RNA, on one or more GAM336317 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336317 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336317 RNA, herein designated GAM RNA, of GAM336317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336317 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336317 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336317 RNA correlate with, and may be deduced from, the identity of the GAM336317 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336318 6259 CTTGAACCCG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAAGCAGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTGCAGTGA Messenger 336318 (GAM336318) oligonucleotides modulates expression of respective target

GCCGACATCG genes whose function and utility is known in the art.

TGCCACTGCA GAM336318 is a novel bioinformatically detectable regulatory, non protein
CTCCAGCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336318 was
detected
GGCAACAAG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen
gene
encoded by the human genome.

GAM336318 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336318 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA
genes
GAM336318 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336318 precursor RNA is designated SEQ ID:6259, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6259 is located from position 7839733 to position 7839801 relative to chromosome 17 on the `-` strand.

GAM336318 precursor RNA folds onto itself, forming GAM336318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336318 precursor RNA, designated SEQ ID NO: 6259, and a schematic representation of a predicted secondary folding of GAM336318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336318 folded precursor RNA yielding a GAM336318 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336318 RNA, hereby incorporated herein. Expression of GAM336318 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336318 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336318 target RNA, herein designated GAM TARGET RNA.

GAM336318 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336318 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336318 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336318 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336318 RNA, herein designated GAM RNA, to target binding sites on GAM336318 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336318 target RNA into GAM336318 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336318 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336318 target genes. The mRNA of each one of this plurality of GAM336318 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336318 RNA, herein designated GAM RNA, and which when bound by GAM336318 RNA causes inhibition of translation of the GAM336318 target mRNA into a corresponding GAM336318 target protein.

The mechanism of the translational inhibition exerted by GAM336318 RNA, herein designated GAM RNA, on one or more GAM336318 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336318 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336318 RNA, herein designated GAM RNA, of GAM336318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336318 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336318 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336318 RNA correlate with, and may be deduced from, the identity of the GAM336318 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336320 7160 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AACTCAGGAA Messenger 336320 (GAM336320) oligonucleotides modulates expression of respective target
GCGGAGGTCG genes whose function and utility is known in the art.

CAGTAAGCTG GAM336320 is a novel bioinformatically detectable regulatory, non protein
AGATCATGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336320 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGCGAG encoded by the human genome.

ACTCTGTCTC GAM336320 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM336320 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336320 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336320 precursor RNA is designated SEQ ID:7160, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7160 is located from position 8370724 to position 8370824 relative to chromosome 17 on the `+` strand.

GAM336320 precursor RNA folds onto itself, forming GAM336320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336320 precursor RNA, designated SEQ ID NO: 7160, and a schematic representation of a predicted secondary folding of GAM336320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336320 folded precursor RNA yielding a GAM336320 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336320 RNA, hereby incorporated herein.

Expression of GAM336320 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336320 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336320 target RNA, herein designated GAM TARGET RNA.

GAM336320 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336320 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336320 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336320 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336320 RNA, herein designated GAM RNA, to target binding sites on GAM336320 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336320 target RNA into GAM336320 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336320 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336320 target genes. The mRNA of each one of this plurality of GAM336320 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336320 RNA, herein designated GAM RNA, and which when bound by GAM336320 RNA causes inhibition of translation of the GAM336320 target mRNA into a corresponding GAM336320 target protein.

The mechanism of the translational inhibition exerted by GAM336320 RNA, herein designated GAM RNA, on one or more GAM336320 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336320 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336320 RNA, herein designated GAM RNA, of GAM336320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336320 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336320 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336320 RNA correlate with, and may be deduced from, the identity of the GAM336320 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTGAACTCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAGCGGAGG Messenger 336321 (GAM336321) oligonucleotides modulates expression of respective target
TCGCAGTAAG genes whose function and utility is known in the art.

CTGAGATCAT GAM336321 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336321 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCT encoded by the human genome.

GAM336321 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336321 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336321 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336321 precursor RNA is designated SEQ ID:6675, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6675 is located from position 8370731 to position 8370818 relative to chromosome 17 on the `+` strand.

GAM336321 precursor RNA folds onto itself, forming GAM336321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336321 precursor RNA, designated SEQ ID NO: 6675, and a schematic representation of a predicted secondary folding of GAM336321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336321 folded precursor RNA yielding a GAM336321 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336321 RNA, hereby incorporated herein. Expression of GAM336321 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336321 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336321 target RNA, herein designated GAM TARGET RNA.

GAM336321 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336321 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336321 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336321 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336321 RNA, herein designated GAM RNA, to target binding sites on GAM336321 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336321 target RNA into GAM336321 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336321 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336321 target genes. The mRNA of each one of this plurality of GAM336321 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336321 RNA, herein designated GAM RNA, and which when bound by GAM336321 RNA causes inhibition of translation of the GAM336321 target mRNA into a corresponding GAM336321 target protein.

The mechanism of the translational inhibition exerted by GAM336321 RNA, herein designated GAM RNA, on one or more GAM336321 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336321 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336321 RNA, herein designated GAM RNA, of GAM336321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336321 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336321 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336321 RNA correlate with, and may be deduced from, the identity of the GAM336321 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336322 5836 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336322 (GAM336322) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336322 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336322 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336322 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336322 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336322 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336322 precursor RNA is designated SEQ ID:5836, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5836 is located from position 8383107 to position 8383188 relative to chromosome 11 on the `-` strand.

GAM336322 precursor RNA folds onto itself, forming GAM336322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336322 precursor RNA, designated SEQ ID NO: 5836, and a schematic representation of a predicted secondary folding of GAM336322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336322 folded precursor RNA yielding a GAM336322 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336322 RNA, hereby incorporated herein.

GAM336322 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336322 target RNA, herein designated GAM TARGET RNA.

GAM336322 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336322 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336322 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336322 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336322 RNA, herein designated GAM RNA, to target binding sites on GAM336322 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336322 target RNA into GAM336322 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336322 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336322 target genes. The mRNA of each one of this plurality of GAM336322 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336322 RNA, herein designated GAM RNA, and which when bound by GAM336322 RNA causes inhibition of translation of the GAM336322 target mRNA into a corresponding GAM336322 target protein.

The mechanism of the translational inhibition exerted by GAM336322 RNA, herein designated GAM RNA, on one or more GAM336322 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336322 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336322 RNA, herein designated GAM RNA, of GAM336322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336322 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336322 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336322 RNA correlate with, and may be deduced from, the identity of the GAM336322 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336323 5715 AGAATCACTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAACGTGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCAGAGGCT Messenger 336323 (GAM336323) oligonucleotides modulates expression of respective target

GCAGTGAGCC genes whose function and utility is known in the art.

GAGATCGTGC GAM336323 is a novel bioinformatically detectable regulatory, non protein

CACTGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336323 was detected

CAGCCTGGGC is described with additional reference to Figs. 9-15.

AACAGAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACT encoded by the human genome.

GAM336323 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336323 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336323 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336323 precursor RNA is designated SEQ

ID:5715, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5715 is located from position 8427810 to position 8427893 relative to chromosome 19 on the `+` strand.

GAM336323 precursor RNA folds onto itself, forming GAM336323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336323 precursor RNA, designated SEQ ID NO: 5715, and a schematic representation of a predicted secondary folding of GAM336323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336323 folded precursor RNA yielding a GAM336323 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336323 RNA, hereby incorporated herein. Expression of GAM336323 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336323 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336323 target RNA, herein designated GAM TARGET RNA.

GAM336323 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336323 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336323 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336323 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336323 RNA, herein designated GAM RNA, to target binding sites on GAM336323 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336323 target RNA

into GAM336323 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336323 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336323 target genes. The mRNA of each one of this plurality of GAM336323 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336323 RNA, herein designated GAM RNA, and which when bound by GAM336323 RNA causes inhibition of translation of the GAM336323 target mRNA into a corresponding GAM336323 target protein.

The mechanism of the translational inhibition exerted by GAM336323 RNA, herein designated GAM RNA, on one or more GAM336323 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336323 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336323 RNA, herein designated GAM RNA, of GAM336323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336323 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336323 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336323 RNA correlate with, and may be deduced from, the identity of the GAM336323 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336324 6253 CTTCACCTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTCACTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTTCTCCAG Messenger 336324 (GAM336324) oligonucleotides modulates expression of respective target

GGATATTAAC genes whose function and utility is known in the art.

CTGGACTTTA GAM336324 is a novel bioinformatically detectable regulatory, non protein

AGAGTCAGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336324 was detected

TGAGTCCCTG is described with additional reference to Figs. 9-15.

GGACTAGTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGCCCATCCA encoded by the human genome.

GGATTCAGAC GAM336324 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGGAAG GAM336324 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336324 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336324 precursor RNA is designated SEQ ID:6253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6253 is located from position 8553447 to position 8553552 relative to chromosome 19 on the `-` strand.

GAM336324 precursor RNA folds onto itself, forming GAM336324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336324 precursor RNA, designated SEQ ID NO: 6253, and a schematic representation of a predicted secondary folding of GAM336324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336324 folded precursor RNA yielding a GAM336324 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336324 RNA, hereby incorporated herein.

GAM336324 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336324 target RNA, herein designated GAM TARGET RNA.

GAM336324 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336324 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336324 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336324 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336324 RNA, herein designated GAM RNA, to target binding sites on GAM336324 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336324 target RNA into GAM336324 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336324 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336324 target genes. The mRNA of each one of this plurality of GAM336324 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336324 RNA, herein designated GAM RNA, and which when bound by GAM336324 RNA causes inhibition of translation of the GAM336324 target mRNA into a corresponding GAM336324 target protein.

The mechanism of the translational inhibition exerted by GAM336324 RNA, herein designated GAM RNA, on one or more GAM336324 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336324 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336324 RNA, herein designated GAM RNA, of GAM336324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336324 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336324 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336324 RNA correlate with, and may be deduced from, the identity of the GAM336324 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336325 6739 GGCATGAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGCTTGAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCGGGAGGCG Messenger 336325 (GAM336325) oligonucleotides modulates expression of respective target

GAGGCTGCAG genes whose function and utility is known in the art.

TGAGCCAAGA GAM336325 is a novel bioinformatically detectable regulatory, non protein
TCGTGCCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336325 was detected
GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGTGAGACT encoded by the human genome.

CTGTC GAM336325 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336325 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336325 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336325 precursor RNA is designated SEQ ID:6739, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6739 is located from position 8562574 to position 8562668 relative to chromosome 8 on the `+` strand.

GAM336325 precursor RNA folds onto itself, forming GAM336325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336325 precursor RNA, designated SEQ ID NO: 6739, and a schematic representation of a predicted secondary folding of GAM336325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336325 folded precursor RNA yielding a GAM336325 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336325 RNA, hereby incorporated herein. Expression of GAM336325 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336325 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336325 target RNA, herein designated GAM TARGET RNA.

GAM336325 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336325 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336325 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336325 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336325 RNA, herein designated GAM RNA, to target binding sites on GAM336325 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336325 target RNA into GAM336325 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336325 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336325 target genes. The mRNA of each one of this plurality of GAM336325 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336325 RNA, herein designated GAM RNA, and which when bound by GAM336325 RNA causes inhibition of translation of the GAM336325 target mRNA into a corresponding GAM336325 target protein.

The mechanism of the translational inhibition exerted by GAM336325 RNA, herein designated GAM RNA, on one or more GAM336325 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336325 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336325 RNA, herein designated GAM RNA, of GAM336325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336325 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336325 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336325

RNA correlate with, and may be deduced from, the identity of the GAM336325 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCCTTCCTAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336329 was detected
TCACAGGGTT is described with additional reference to Figs. 9-15.

GCTGCGAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGTGAGT encoded by the human genome.

TGGC GAM336329 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336329 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336329 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336329 precursor RNA is designated SEQ ID:6935, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6935 is located from position 9095043 to position 9095136 relative to chromosome 17 on the `-` strand.

GAM336329 precursor RNA folds onto itself, forming GAM336329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336329 precursor RNA, designated SEQ ID NO: 6935, and a schematic representation of a predicted secondary folding of GAM336329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336329 folded precursor RNA yielding a GAM336329 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336329 RNA, hereby incorporated herein.

GAM336329 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336329 target RNA, herein designated GAM TARGET RNA.

GAM336329 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336329 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336329 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336329 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336329 RNA, herein designated GAM RNA, to target binding sites on GAM336329 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336329 target RNA into GAM336329 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336329 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336329 target genes. The mRNA of each one of this plurality of GAM336329 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336329 RNA, herein designated GAM RNA, and which when bound by GAM336329 RNA causes inhibition of translation of the GAM336329 target mRNA into a corresponding GAM336329 target protein.

The mechanism of the translational inhibition exerted by GAM336329 RNA, herein designated GAM RNA, on one or more GAM336329 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336329 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336329 RNA, herein designated GAM RNA, of GAM336329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336329 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336329 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336329 RNA correlate with, and may be deduced from, the identity of the GAM336329 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336330 5837 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336330 (GAM336330) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336330 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336330 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336330 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336330 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336330 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336330 precursor RNA is designated SEQ ID:5837, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5837 is located from position 9107249 to position 9107330 relative to chromosome 10 on the `+` strand.

GAM336330 precursor RNA folds onto itself, forming GAM336330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336330 precursor RNA, designated SEQ ID NO: 5837, and a schematic representation of a predicted secondary folding of GAM336330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336330 folded precursor RNA yielding a GAM336330 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336330 RNA, hereby incorporated herein.

GAM336330 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336330 target RNA, herein designated GAM TARGET RNA.

GAM336330 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336330 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336330 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336330 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336330 RNA, herein designated GAM RNA, to target binding sites on GAM336330 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336330 target RNA into GAM336330 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336330 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336330 target genes. The mRNA of each one of this plurality of GAM336330 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336330 RNA, herein designated GAM RNA, and which when bound by GAM336330 RNA causes inhibition of translation of the GAM336330 target mRNA into a corresponding GAM336330 target protein.

The mechanism of the translational inhibition exerted by GAM336330 RNA, herein designated GAM RNA, on one or more GAM336330 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336330 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336330 RNA, herein designated GAM RNA, of GAM336330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336330 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336330 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336330 RNA correlate with, and may be deduced from, the identity of the GAM336330 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336331 6227 CTGGCATACA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAGCCCGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTTCTGCCG Messenger 336331 (GAM336331) oligonucleotides modulates expression of respective target

ATTTGTCACT genes whose function and utility is known in the art.

GCAATCAACA GAM336331 is a novel bioinformatically detectable regulatory, non protein

ATACTCCCCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336331 was detected

GAACATCGGC is described with additional reference to Figs. 9-15.

AAGGATGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTTTCAGAT encoded by the human genome.

GCTGGTGTGC GAM336331 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTGGGAGCCA GAM336331 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

G GAM336331 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336331 precursor RNA is designated SEQ

ID:6227, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6227 is located from position 9202641 to position 9202751 relative to chromosome 11 on the `-` strand.

GAM336331 precursor RNA folds onto itself, forming GAM336331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336331 precursor RNA, designated SEQ ID NO: 6227, and a schematic representation of a predicted secondary folding of GAM336331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336331 folded precursor RNA yielding a GAM336331 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336331 RNA, hereby incorporated herein.

GAM336331 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336331 target RNA, herein designated GAM TARGET RNA.

GAM336331 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336331 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336331 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336331 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336331 RNA, herein designated GAM RNA, to target binding sites on GAM336331 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336331 target RNA into GAM336331 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336331 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336331 target genes. The mRNA of each one of this plurality of GAM336331 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336331 RNA, herein designated GAM RNA, and which when bound by GAM336331 RNA causes inhibition of translation of the GAM336331 target mRNA into a corresponding GAM336331 target protein.

The mechanism of the translational inhibition exerted by GAM336331 RNA, herein designated GAM RNA, on one or more GAM336331 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336331 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336331 RNA, herein designated GAM RNA, of GAM336331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336331 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336331 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336331 RNA correlate with, and may be deduced from, the identity of the GAM336331 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336332 6221 CTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAGGAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGATTGCAG Messenger 336332 (GAM336332) oligonucleotides modulates expression of respective target

TGAGTCAAGA genes whose function and utility is known in the art.

TGGCACTACT GAM336332 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336332 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

G GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336332 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336332 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336332 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336332 precursor RNA is designated SEQ ID:6221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6221 is located from position 9215763 to position 9215833 relative to chromosome 11 on the `+` strand.

GAM336332 precursor RNA folds onto itself, forming GAM336332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336332 precursor RNA, designated SEQ ID NO: 6221, and a schematic representation of a predicted secondary folding of GAM336332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336332 folded precursor RNA yielding a GAM336332 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336332 RNA, hereby incorporated herein. Expression of GAM336332 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336332 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336332 target RNA, herein designated GAM TARGET RNA.

GAM336332 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336332 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336332 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336332 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336332 RNA, herein designated GAM RNA, to target binding sites on GAM336332 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336332 target RNA into GAM336332 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336332 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336332 target genes. The mRNA of each one of this plurality of GAM336332 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336332 RNA, herein designated GAM RNA, and which when bound by GAM336332 RNA causes inhibition of translation of the GAM336332 target mRNA into a corresponding GAM336332 target protein.

The mechanism of the translational inhibition exerted by GAM336332 RNA, herein designated GAM RNA, on one or more GAM336332 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336332 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336332 RNA, herein designated GAM RNA, of GAM336332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336332 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336332 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336332 RNA correlate with, and may be deduced from, the identity of the GAM336332 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336335 (GAM336335) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336335 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336335 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336335 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336335 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336335 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336335 precursor RNA is designated SEQ ID:6421, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6421 is located from position 9504193 to position 9504292 relative to chromosome 11 on the `+` strand.

GAM336335 precursor RNA folds onto itself, forming GAM336335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336335 precursor RNA, designated SEQ ID NO: 6421, and a schematic representation of a predicted secondary folding of GAM336335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336335 folded precursor RNA yielding a GAM336335 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336335 RNA, hereby incorporated herein. Expression of GAM336335 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336335 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336335 target RNA, herein designated GAM TARGET RNA.

GAM336335 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336335 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336335 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336335 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336335 RNA, herein designated GAM RNA, to target binding sites on GAM336335 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336335 target RNA into GAM336335 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336335 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336335 target genes. The mRNA of each one of this plurality of GAM336335 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336335 RNA, herein designated GAM RNA, and which when bound by GAM336335 RNA causes inhibition of translation of the GAM336335 target mRNA into a corresponding GAM336335 target protein.

The mechanism of the translational inhibition exerted by GAM336335 RNA, herein designated GAM RNA, on one or more GAM336335 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336335 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336335 RNA, herein designated GAM RNA, of GAM336335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336335 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336335 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336335 RNA correlate with, and may be deduced from, the identity of the GAM336335 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336336 7139 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCAGGAG Messenger 336336 (GAM336336) oligonucleotides modulates expression of respective target
GTGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336336 is a novel bioinformatically detectable regulatory, non protein
AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336336 was detected
ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCAG encoded by the human genome.

AACTCCGTCT GAM336336 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM336336 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336336 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336336 precursor RNA is designated SEQ ID:7139, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7139 is located from position 9554905 to position 9555006 relative to chromosome 2 on the `-` strand.

GAM336336 precursor RNA folds onto itself, forming GAM336336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336336 precursor RNA, designated SEQ ID NO: 7139, and a schematic representation of a predicted secondary folding of GAM336336 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336336 folded precursor RNA yielding a GAM336336 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336336 RNA, hereby incorporated herein. Expression of GAM336336 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336336 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336336 target RNA, herein designated GAM TARGET RNA.

GAM336336 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336336 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336336 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336336 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336336 RNA, herein designated GAM RNA, to target binding sites on GAM336336 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336336 target RNA into GAM336336 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336336 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336336 target genes. The mRNA of each one of this plurality of GAM336336 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336336 RNA, herein designated GAM RNA, and which when bound by GAM336336 RNA causes inhibition of translation of the GAM336336 target mRNA into a corresponding GAM336336 target protein.

The mechanism of the translational inhibition exerted by GAM336336 RNA, herein designated GAM RNA, on one or more GAM336336 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336336 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336336 RNA, herein designated GAM RNA, of GAM336336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336336 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336336 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336336 RNA correlate with, and may be deduced from, the identity of the GAM336336 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336337 6633 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 336337 (GAM336337) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM336337 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336337 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAACTCC encoded by the human genome.

GAM336337 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336337 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336337 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336337 precursor RNA is designated SEQ ID:6633, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6633 is located from position 9554911 to position 9554999 relative to chromosome 2 on the `-` strand.

GAM336337 precursor RNA folds onto itself, forming GAM336337 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336337 precursor RNA, designated SEQ ID NO: 6633, and a schematic representation of a predicted secondary folding of GAM336337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336337 folded precursor RNA yielding a GAM336337 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336337 RNA, hereby incorporated herein. Expression of GAM336337 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336337 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336337 target RNA, herein designated GAM TARGET RNA.

GAM336337 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336337 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336337 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336337 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336337 RNA, herein designated GAM RNA, to target binding sites on GAM336337 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336337 target RNA into GAM336337 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336337 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336337 target genes. The mRNA of each one of this

plurality of GAM336337 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336337 RNA, herein designated GAM RNA, and which when bound by GAM336337 RNA causes inhibition of translation of the GAM336337 target mRNA into a corresponding GAM336337 target protein.

The mechanism of the translational inhibition exerted by GAM336337 RNA, herein designated GAM RNA, on one or more GAM336337 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336337 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336337 RNA, herein designated GAM RNA, of GAM336337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336337 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336337 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336337 RNA correlate with, and may be deduced from, the identity of the GAM336337 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336338 6927 GTGTGATATA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTGGTCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GATCATGGCT Messenger 336338 (GAM336338) oligonucleotides modulates expression of respective target

GGACAAACAC genes whose function and utility is known in the art.

AATGCAGTAG GAM336338 is a novel bioinformatically detectable regulatory, non protein

GAAGAGTGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336338 was detected

GGCTCTTGGT is described with additional reference to Figs. 9-15.

CACTGCTGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGACCCAATG encoded by the human genome.

ATCTTGAGCA GAM336338 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCACCCGTCA GAM336338 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

TAC GAM336338 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336338 precursor RNA is designated SEQ ID:6927, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6927 is located from position 9584579 to position 9584691 relative to chromosome 18 on the `+` strand.

GAM336338 precursor RNA folds onto itself, forming GAM336338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336338 precursor RNA, designated SEQ ID NO: 6927, and a schematic representation of a predicted secondary folding of GAM336338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336338 folded precursor RNA yielding a GAM336338 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336338 RNA, hereby incorporated herein.

GAM336338 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336338 target RNA, herein designated GAM TARGET RNA.

GAM336338 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336338 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336338 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336338 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336338 RNA, herein designated GAM RNA, to target binding sites on GAM336338 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336338 target RNA into GAM336338 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336338 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336338 target genes. The mRNA of each one of this plurality of GAM336338 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336338 RNA, herein designated GAM RNA, and which when bound by GAM336338 RNA causes inhibition of translation of the GAM336338 target mRNA into a corresponding GAM336338 target protein.

The mechanism of the translational inhibition exerted by GAM336338 RNA, herein designated GAM RNA, on one or more GAM336338 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336338 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336338 RNA, herein designated GAM RNA, of GAM336338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336338 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336338 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336338 RNA correlate with, and may be deduced from, the identity of the GAM336338 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336339 6425 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTGGTGGG Messenger 336339 (GAM336339) oligonucleotides modulates expression of respective target

GCAGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336339 is a novel bioinformatically detectable regulatory, non protein

AGATAACGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336339 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGTAAA encoded by the human genome.

ACTCCGTCTC GAM336339 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336339 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336339 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336339 precursor RNA is designated SEQ ID:6425, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6425 is located from position 9731276 to position 9731375 relative to chromosome 18 on the `+` strand.

GAM336339 precursor RNA folds onto itself, forming GAM336339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336339 precursor RNA, designated SEQ ID NO: 6425, and a schematic representation of a predicted secondary folding of GAM336339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336339 folded precursor RNA yielding a GAM336339 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336339 RNA, hereby incorporated herein. Expression of GAM336339 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336339 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336339 target RNA, herein designated GAM TARGET RNA.

GAM336339 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336339 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336339 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336339 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336339 RNA, herein designated GAM RNA, to target binding sites on GAM336339 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336339 target RNA into GAM336339 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336339 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336339 target genes. The mRNA of each one of this plurality of GAM336339 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336339 RNA, herein designated GAM RNA, and which when bound by GAM336339 RNA causes inhibition of translation of the GAM336339 target mRNA into a corresponding GAM336339 target protein.

The mechanism of the translational inhibition exerted by GAM336339 RNA, herein designated GAM RNA, on one or more GAM336339 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336339 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336339 RNA, herein designated GAM RNA, of GAM336339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336339 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336339 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336339 RNA correlate with, and may be deduced from, the identity of the GAM336339 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336340 6406 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGTTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCTGGGAAG Messenger 336340 (GAM336340) oligonucleotides modulates expression of respective target
CGGAGGTTGC genes whose function and utility is known in the art.

CGTGAGTCGA GAM336340 is a novel bioinformatically detectable regulatory, non protein
GATCATGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336340 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGCGAA encoded by the human genome.

ACTCTCTC GAM336340 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336340 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336340 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336340 precursor RNA is designated SEQ ID:6406, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6406 is located from position 9732603 to position 9732700 relative to chromosome 3 on the `+` strand.

GAM336340 precursor RNA folds onto itself, forming GAM336340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336340 precursor RNA, designated SEQ ID NO: 6406, and a schematic representation of a predicted secondary folding of GAM336340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336340 folded precursor RNA yielding a GAM336340 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336340 RNA, hereby incorporated herein. Expression of GAM336340 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336340 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336340 target RNA, herein designated GAM TARGET RNA.

GAM336340 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336340 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336340 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336340 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336340 RNA, herein designated GAM RNA, to target binding sites on GAM336340 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336340 target RNA into GAM336340 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336340 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336340 target genes. The mRNA of each one of this plurality of GAM336340 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336340 RNA, herein designated GAM RNA, and which when bound by GAM336340 RNA causes inhibition of translation of the GAM336340 target mRNA into a corresponding GAM336340 target protein.

The mechanism of the translational inhibition exerted by GAM336340 RNA, herein designated GAM RNA, on one or more GAM336340 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336340 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336340 RNA, herein designated GAM RNA, of GAM336340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336340 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336340 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336340 RNA correlate with, and may be deduced from, the identity of the GAM336340 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336341 (GAM336341) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336341 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336341 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336341 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336341 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336341 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336341 precursor RNA is designated SEQ ID:5718, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5718 is located from position 9793682 to position 9793765 relative to chromosome 3 on the `+` strand.

GAM336341 precursor RNA folds onto itself, forming GAM336341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336341 precursor RNA, designated SEQ ID NO: 5718, and a schematic representation of a predicted secondary folding of GAM336341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336341 folded precursor RNA yielding a GAM336341 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336341 RNA, hereby incorporated herein. Expression of GAM336341 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336341 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336341 target RNA, herein designated GAM TARGET RNA.

GAM336341 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336341 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336341 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336341 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336341 RNA, herein designated GAM RNA, to target binding sites on GAM336341 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336341 target RNA into GAM336341 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336341 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336341 target genes. The mRNA of each one of this plurality of GAM336341 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336341 RNA, herein designated GAM RNA, and which when bound by GAM336341 RNA causes inhibition of translation of the GAM336341 target mRNA into a corresponding GAM336341 target protein.

The mechanism of the translational inhibition exerted by GAM336341 RNA, herein designated GAM RNA, on one or more GAM336341 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336341 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336341 RNA, herein designated GAM RNA, of GAM336341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336341 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336341 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336341 RNA correlate with, and may be deduced from, the identity of the GAM336341 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336342 7310 TTGCTCGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGGGAGACA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 336342 (GAM336342) oligonucleotides modulates expression of respective target

TGAGCCGAGA genes whose function and utility is known in the art.

TTGTGCCACT GAM336342 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336342 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336342 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336342 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336342 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336342 precursor RNA is designated SEQ ID:7310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7310 is located from position 9793686 to position 9793761 relative to chromosome 3 on the `+` strand.

GAM336342 precursor RNA folds onto itself, forming GAM336342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336342 precursor RNA, designated SEQ ID NO: 7310, and a schematic representation of a predicted secondary folding of GAM336342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336342 folded precursor RNA yielding a GAM336342 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336342 RNA, hereby incorporated herein. Expression of GAM336342 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336342 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336342 target RNA, herein designated GAM TARGET RNA.

GAM336342 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336342 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336342 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336342 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336342 RNA, herein designated GAM RNA, to target binding sites on GAM336342 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336342 target RNA into GAM336342 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336342 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336342 target genes. The mRNA of each one of this plurality of GAM336342 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336342 RNA, herein designated GAM RNA, and which when bound by GAM336342 RNA causes inhibition of translation of the GAM336342 target mRNA into a corresponding GAM336342 target protein.

The mechanism of the translational inhibition exerted by GAM336342 RNA, herein designated GAM RNA, on one or more GAM336342 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336342 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336342 RNA, herein designated GAM RNA, of GAM336342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336342 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336342 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336342 RNA correlate with, and may be deduced from, the identity of the GAM336342 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGGCAACAGA is described with additional reference to Figs. 9-15.

GC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336343 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336343 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336343 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336343 precursor RNA is designated SEQ ID:6535, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6535 is located from position 9793688 to position 9793759 relative to chromosome 3 on the `+` strand.

GAM336343 precursor RNA folds onto itself, forming GAM336343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336343 precursor RNA, designated SEQ ID NO: 6535, and a schematic representation of a predicted secondary folding of GAM336343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336343 folded precursor RNA yielding a GAM336343 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336343 RNA, hereby incorporated herein. Expression of GAM336343 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336343 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336343 target RNA, herein designated GAM TARGET RNA.

GAM336343 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336343 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336343 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336343 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336343 RNA, herein designated GAM RNA, to target binding sites on GAM336343 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336343 target RNA into GAM336343 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336343 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336343 target genes. The mRNA of each one of this plurality of GAM336343 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336343 RNA, herein designated GAM RNA, and which when bound by GAM336343 RNA causes inhibition of translation of the GAM336343 target mRNA into a corresponding GAM336343 target protein.

The mechanism of the translational inhibition exerted by GAM336343 RNA, herein designated GAM RNA, on one or more GAM336343 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336343 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336343 RNA, herein designated GAM RNA, of GAM336343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336343 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336343 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336343 RNA correlate with, and may be deduced from, the identity of the GAM336343 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336347 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336347 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336347 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336347 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336347 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336347 precursor RNA is designated SEQ ID:5726, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5726 is located from position 10064670 to position 10064749 relative to chromosome 19 on the `+` strand.

GAM336347 precursor RNA folds onto itself, forming GAM336347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336347 precursor RNA, designated SEQ ID NO: 5726, and a schematic representation of a predicted secondary folding of GAM336347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336347 folded precursor RNA yielding a GAM336347 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336347 RNA, hereby incorporated herein.

GAM336347 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336347 target RNA, herein designated GAM TARGET RNA.

GAM336347 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336347 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336347 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336347 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336347 RNA, herein designated GAM RNA, to target binding sites on GAM336347 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336347 target RNA into GAM336347 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336347 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336347 target genes. The mRNA of each one of this plurality of GAM336347 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336347 RNA, herein designated GAM RNA, and which when bound by GAM336347 RNA causes inhibition of translation of the GAM336347 target mRNA into a corresponding GAM336347 target protein.

The mechanism of the translational inhibition exerted by GAM336347 RNA, herein designated GAM RNA, on one or more GAM336347 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336347 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336347 RNA, herein designated GAM RNA, of GAM336347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336347 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336347 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336347 RNA correlate with, and may be deduced from, the identity of the GAM336347 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336348 5838 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336348 (GAM336348) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336348 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336348 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336348 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336348 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336348 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336348 precursor RNA is designated SEQ ID:5838, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5838 is located from position 10077912 to position 10077993 relative to chromosome 4 on the `-` strand.

GAM336348 precursor RNA folds onto itself, forming GAM336348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336348 precursor RNA, designated SEQ ID NO: 5838, and a schematic representation of a predicted secondary folding of GAM336348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336348 folded precursor RNA yielding a GAM336348 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336348 RNA, hereby incorporated herein.

GAM336348 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336348 target RNA, herein designated GAM TARGET RNA.

GAM336348 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336348 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336348 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336348 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336348 RNA, herein designated GAM RNA, to target binding sites on GAM336348 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336348 target RNA into GAM336348 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336348 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336348 target genes. The mRNA of each one of this plurality of GAM336348 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336348 RNA, herein designated GAM RNA, and which when bound by GAM336348 RNA causes inhibition of translation of the GAM336348 target mRNA into a corresponding GAM336348 target protein.

The mechanism of the translational inhibition exerted by GAM336348 RNA, herein designated GAM RNA, on one or more GAM336348 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336348 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336348 RNA, herein designated GAM RNA, of GAM336348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336348 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336348 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336348 RNA correlate with, and may be deduced from, the identity of the GAM336348 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336349 7088 TGAATTTGTG Fig. 8 further provides a conceptual description of another novel bioinformatically
ACTTGTCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
TTTGGCATCT Messenger 336349 (GAM336349) oligonucleotides modulates expression of respective target
CGAAGGGCTT genes whose function and utility is known in the art.

TCTCTACTGG GAM336349 is a novel bioinformatically detectable regulatory, non protein
GTCCAGGGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336349 was detected
CCACAGAACA is described with additional reference to Figs. 9-15.

GGTCAGCATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CA encoded by the human genome.

GAM336349 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336349 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336349 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336349 precursor RNA is designated SEQ ID:7088, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7088 is located from position 10202193 to position 10202274 relative to chromosome 7 on the `-` strand.

GAM336349 precursor RNA folds onto itself, forming GAM336349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336349 precursor RNA, designated SEQ ID NO: 7088, and a schematic representation of a predicted secondary folding of GAM336349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336349 folded precursor RNA yielding a GAM336349 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336349 RNA, hereby incorporated herein.

GAM336349 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336349 target RNA, herein designated GAM TARGET RNA.

GAM336349 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336349 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336349 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336349 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336349 RNA, herein designated GAM RNA, to target binding sites on GAM336349 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336349 target RNA into GAM336349 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336349 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336349 target genes. The mRNA of each one of this plurality of GAM336349 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336349 RNA, herein designated GAM RNA, and which when bound by GAM336349 RNA causes inhibition of translation of the GAM336349 target mRNA into a corresponding GAM336349 target protein.

The mechanism of the translational inhibition exerted by GAM336349 RNA, herein designated GAM RNA, on one or more GAM336349 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336349 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336349 RNA, herein designated GAM RNA, of GAM336349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336349 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336349 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336349 RNA correlate with, and may be deduced from, the identity of the GAM336349 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336350 6403 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGAGCCAA GAM336350 is a novel bioinformatically detectable regulatory, non protein
GGTCACACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336350 was detected
CTTGCACTCC is described with additional reference to Figs. 9-15.

ACAGCCTGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGACAGAGTG encoded by the human genome.

AGACTGCCTC GAM336350 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336350 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336350 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336350 precursor RNA is designated SEQ ID:6403, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6403 is located from position 10212232 to position 10212331 relative to chromosome 19 on the `+` strand.

GAM336350 precursor RNA folds onto itself, forming GAM336350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336350 precursor RNA, designated SEQ ID NO: 6403, and a schematic representation of a predicted secondary folding of GAM336350 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336350 folded precursor RNA yielding a GAM336350 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336350 RNA, hereby incorporated herein.

GAM336350 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336350 target RNA, herein designated GAM TARGET RNA.

GAM336350 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336350 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336350 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336350 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336350 RNA, herein designated GAM RNA, to target binding sites on GAM336350 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336350 target RNA into GAM336350 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336350 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336350 target genes. The mRNA of each one of this plurality of GAM336350 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336350 RNA, herein designated GAM RNA, and which when bound by GAM336350 RNA causes inhibition of translation of the GAM336350 target mRNA into a corresponding GAM336350 target protein.

The mechanism of the translational inhibition exerted by GAM336350 RNA, herein designated GAM RNA, on one or more GAM336350 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336350 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336350 RNA, herein designated GAM RNA, of GAM336350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336350 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336350 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336350 RNA correlate with, and may be deduced from, the identity of the GAM336350 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336352 5839 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336352 (GAM336352) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336352 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336352 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336352 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336352 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336352 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336352 precursor RNA is designated SEQ ID:5839, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5839 is located from position 10343377 to position 10343458 relative to chromosome 8 on the `-` strand.

GAM336352 precursor RNA folds onto itself, forming GAM336352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336352 precursor RNA, designated SEQ ID NO: 5839, and a schematic representation of a predicted secondary folding of GAM336352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336352 folded precursor RNA yielding a GAM336352 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336352 RNA, hereby incorporated herein.

GAM336352 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336352 target RNA, herein designated GAM TARGET RNA.

GAM336352 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336352 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336352 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336352 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336352 RNA, herein designated GAM RNA, to target binding sites on GAM336352 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336352 target RNA into GAM336352 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336352 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336352 target genes. The mRNA of each one of this plurality of GAM336352 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336352 RNA, herein designated GAM RNA, and which when bound by GAM336352 RNA causes inhibition of translation of the GAM336352 target mRNA into a corresponding GAM336352 target protein.

The mechanism of the translational inhibition exerted by GAM336352 RNA, herein designated GAM RNA, on one or more GAM336352 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336352 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336352 RNA, herein designated GAM RNA, of GAM336352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336352 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336352 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336352 RNA correlate with, and may be deduced from, the identity of the GAM336352 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336353 6410 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATGGCGCGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCGGGAAG Messenger 336353 (GAM336353) oligonucleotides modulates expression of respective target

TGGAGCTTGC genes whose function and utility is known in the art.

AGTGAGCCGA GAM336353 is a novel bioinformatically detectable regulatory, non protein

GATCGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336353 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGCGAAA encoded by the human genome.

CTCCGTCTC GAM336353 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336353 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336353 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336353 precursor RNA is designated SEQ ID:6410, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6410 is located from position 10535996 to position 10536094 relative to chromosome 16 on the `+` strand.

GAM336353 precursor RNA folds onto itself, forming GAM336353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336353 precursor RNA, designated SEQ ID NO: 6410, and a schematic representation of a predicted secondary folding of GAM336353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336353 folded precursor RNA yielding a GAM336353 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336353 RNA, hereby incorporated herein. Expression of GAM336353 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336353 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336353 target RNA, herein designated GAM TARGET RNA.

GAM336353 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336353 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336353 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336353 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336353 RNA, herein designated GAM RNA, to target binding sites on GAM336353 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336353 target RNA into GAM336353 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336353 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336353 target genes. The mRNA of each one of this plurality of GAM336353 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336353 RNA, herein designated GAM RNA, and which when bound by GAM336353 RNA causes inhibition of translation of the GAM336353 target mRNA into a corresponding GAM336353 target protein.

The mechanism of the translational inhibition exerted by GAM336353 RNA, herein designated GAM RNA, on one or more GAM336353 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336353 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336353 RNA, herein designated GAM RNA, of GAM336353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336353 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336353 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336353 RNA correlate with, and may be deduced from, the identity of the GAM336353 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336354 7097 TGAGACAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACTCCGGAG Messenger 336354 (GAM336354) oligonucleotides modulates expression of respective target

GTTGAGGTTT genes whose function and utility is known in the art.

CAGTGGGCCG GAM336354 is a novel bioinformatically detectable regulatory, non protein

AGACCGAGCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336354 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGCGAG encoded by the human genome.

ACTCCATTTC GAM336354 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336354 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336354 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336354 precursor RNA is designated SEQ ID:7097, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7097 is located from position 10593137 to position 10593237 relative to chromosome 19 on the `+` strand.

GAM336354 precursor RNA folds onto itself, forming GAM336354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336354 precursor RNA, designated SEQ ID NO: 7097, and a schematic representation of a predicted secondary folding of GAM336354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336354 folded precursor RNA yielding a GAM336354 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336354 RNA, hereby incorporated herein. Expression of GAM336354 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336354 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336354 target RNA, herein designated GAM TARGET RNA.

GAM336354 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336354 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336354 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336354 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336354 RNA, herein designated GAM RNA, to target binding sites on GAM336354 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336354 target RNA into GAM336354 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336354 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336354 target genes. The mRNA of each one of this plurality of GAM336354 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336354 RNA, herein designated GAM RNA, and which when bound by GAM336354 RNA causes inhibition of translation of the GAM336354 target mRNA into a corresponding GAM336354 target protein.

The mechanism of the translational inhibition exerted by GAM336354 RNA, herein designated GAM RNA, on one or more GAM336354 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336354 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336354 RNA, herein designated GAM RNA, of GAM336354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336354 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336354 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336354 RNA correlate with, and may be deduced from, the identity of the GAM336354 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336357 7043 TCCTGCATGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTTCCATA detected oligonucleotides of the present invention, referred to here as Genomic Address
TGCAGAGCCA Messenger 336357 (GAM336357) oligonucleotides modulates expression of respective target
GAATCCATCC genes whose function and utility is known in the art.

TTGTTCCTTC GAM336357 is a novel bioinformatically detectable regulatory, non protein
TGCATTGTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336357 was detected
GAAAATCCAT is described with additional reference to Figs. 9-15.

GGAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336357 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336357 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336357 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336357 precursor RNA is designated SEQ ID:7043, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7043 is located from position 10669795 to position 10669870 relative to chromosome 17 on the `-` strand.

GAM336357 precursor RNA folds onto itself, forming GAM336357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336357 precursor RNA, designated SEQ ID NO: 7043, and a schematic representation of a predicted secondary folding of GAM336357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336357 folded precursor RNA yielding a GAM336357 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336357 RNA, hereby incorporated herein.

GAM336357 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336357 target RNA, herein designated GAM TARGET RNA.

GAM336357 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336357 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336357 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336357 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336357 RNA, herein designated GAM RNA, to target binding sites on GAM336357 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336357 target RNA into GAM336357 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336357 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336357 target genes. The mRNA of each one of this plurality of GAM336357 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336357 RNA, herein designated GAM RNA, and which when bound by GAM336357 RNA causes inhibition of translation of the GAM336357 target mRNA into a corresponding GAM336357 target protein.

The mechanism of the translational inhibition exerted by GAM336357 RNA, herein designated GAM RNA, on one or more GAM336357 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336357 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336357 RNA, herein designated GAM RNA, of GAM336357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336357 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336357 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336357

RNA correlate with, and may be deduced from, the identity of the GAM336357 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336359 (GAM336359) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336359 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336359 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336359 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336359 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336359 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336359 precursor RNA is designated SEQ ID:7085, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7085 is located from position 10822733 to position 10822833 relative to chromosome 8 on the `-` strand.

GAM336359 precursor RNA folds onto itself, forming GAM336359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336359 precursor RNA, designated SEQ ID NO: 7085, and a schematic representation of a predicted secondary folding of GAM336359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336359 folded precursor RNA yielding a GAM336359 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336359 RNA, hereby incorporated herein.

GAM336359 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336359 target RNA, herein designated GAM TARGET RNA.

GAM336359 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336359 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336359 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336359 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336359 RNA, herein designated GAM RNA, to target binding sites on GAM336359 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336359 target RNA into GAM336359 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336359 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336359 target genes. The mRNA of each one of this plurality of GAM336359 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336359 RNA, herein designated GAM RNA, and which when bound by GAM336359 RNA causes inhibition of translation of the GAM336359 target mRNA into a corresponding GAM336359 target protein.

The mechanism of the translational inhibition exerted by GAM336359 RNA, herein designated GAM RNA, on one or more GAM336359 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336359 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336359 RNA, herein designated GAM RNA, of GAM336359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336359 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336359 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336359 RNA correlate with, and may be deduced from, the identity of the GAM336359 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336361 RNA, hereby incorporated herein. Expression of GAM336361 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336361 target RNA, herein designated GAM TARGET RNA.

GAM336361 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336361 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336361 RNA, herein designated GAM RNA, to target binding sites on GAM336361 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336361 target RNA into GAM336361 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336361 target genes. The mRNA of each one of this plurality of GAM336361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336361 RNA, herein designated GAM RNA, and which when bound by GAM336361 RNA causes inhibition of translation of the GAM336361 target mRNA into a corresponding GAM336361 target protein.

The mechanism of the translational inhibition exerted by GAM336361 RNA, herein designated GAM RNA, on one or more GAM336361 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336361 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336361 RNA, herein designated GAM RNA, of GAM336361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336361 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336361 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336361 RNA correlate with, and may be deduced from, the identity of the GAM336361 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336362 6116 CCTGACTCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATCACAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAGGAATAAA Messenger 336362 (GAM336362) oligonucleotides modulates expression of respective target

GTCTCATTTC genes whose function and utility is known in the art.

AATCCTGAGC GAM336362 is a novel bioinformatically detectable regulatory, non protein

TTCTCCTAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336362 was detected

TCTTGTGGAT is described with additional reference to Figs. 9-15.

CAGAGCTGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336362 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336362 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336362 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336362 precursor RNA is designated SEQ

ID:6116, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6116 is located from position 10975636 to position 10975715 relative to chromosome X on the `-` strand.

GAM336362 precursor RNA folds onto itself, forming GAM336362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336362 precursor RNA, designated SEQ ID NO: 6116, and a schematic representation of a predicted secondary folding of GAM336362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336362 folded precursor RNA yielding a GAM336362 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336362 RNA, hereby incorporated herein.

GAM336362 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336362 target RNA, herein designated GAM TARGET RNA.

GAM336362 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336362 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336362 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336362 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336362 RNA, herein designated GAM RNA, to target binding sites on GAM336362 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336362 target RNA into GAM336362 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336362 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336362 target genes. The mRNA of each one of this plurality of GAM336362 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336362 RNA, herein designated GAM RNA, and which when bound by GAM336362 RNA causes inhibition of translation of the GAM336362 target mRNA into a corresponding GAM336362 target protein.

The mechanism of the translational inhibition exerted by GAM336362 RNA, herein designated GAM RNA, on one or more GAM336362 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336362 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336362 RNA, herein designated GAM RNA, of GAM336362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336362 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336362 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336362 RNA correlate with, and may be deduced from, the identity of the GAM336362 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336363 5742 AGCAGACTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTAAGACAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTCTGCCTG Messenger 336363 (GAM336363) oligonucleotides modulates expression of respective target

TGGTTGTCTT genes whose function and utility is known in the art.

GGCAAAGCCA GAM336363 is a novel bioinformatically detectable regulatory, non protein

GGTAATGCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336363 was detected

GAGAGGGGTG is described with additional reference to Figs. 9-15.

GACTCAGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCT encoded by the human genome.

GAM336363 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336363 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336363 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336363 precursor RNA is designated SEQ ID:5742, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5742 is located from position 11000648 to position 11000730 relative to chromosome 16 on the `+` strand.

GAM336363 precursor RNA folds onto itself, forming GAM336363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336363 precursor RNA, designated SEQ ID NO: 5742, and a schematic representation of a predicted secondary folding of GAM336363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336363 folded precursor RNA yielding a GAM336363 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336363 RNA, hereby incorporated herein.

GAM336363 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336363 target RNA, herein designated GAM TARGET RNA.

GAM336363 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336363 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336363 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336363 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336363 RNA, herein designated GAM RNA, to target binding sites on GAM336363 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336363 target RNA into GAM336363 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336363 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336363 target genes. The mRNA of each one of this plurality of GAM336363 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336363 RNA, herein designated GAM RNA, and which when bound by GAM336363 RNA causes inhibition of translation of the GAM336363 target mRNA into a corresponding GAM336363 target protein.

The mechanism of the translational inhibition exerted by GAM336363 RNA, herein designated GAM RNA, on one or more GAM336363 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336363 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336363 RNA, herein designated GAM RNA, of GAM336363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336363 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336363 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336363 RNA correlate with, and may be deduced from, the identity of the GAM336363 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336364 7327 TTGCTTTAGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGAGAGGTC genes whose function and utility is known in the art.

AGTACTTTTA GAM336368 is a novel bioinformatically detectable regulatory, non protein
TTTTACCCAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336368 was detected
TTTGTAGGTG is described with additional reference to Figs. 9-15.

AGAAAACTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGCTCAGAAA encoded by the human genome.

GGGTAACACA GAM336368 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GTGACACAG GAM336368 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336368 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336368 precursor RNA is designated SEQ ID:6242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6242 is located from position 11301473 to position 11301581 relative to chromosome 11 on the `+` strand.

GAM336368 precursor RNA folds onto itself, forming GAM336368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336368 precursor RNA, designated SEQ ID NO: 6242, and a schematic representation of a predicted secondary folding of GAM336368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336368 folded precursor RNA yielding a GAM336368 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336368 RNA, hereby incorporated herein.

GAM336368 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336368 target RNA, herein designated GAM TARGET RNA.

GAM336368 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336368 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336368 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336368 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336368 RNA, herein designated GAM RNA, to target binding sites on GAM336368 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336368 target RNA into GAM336368 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336368 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336368 target genes. The mRNA of each one of this plurality of GAM336368 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336368 RNA, herein designated GAM RNA, and which when bound by GAM336368 RNA causes inhibition of translation of the GAM336368 target mRNA into a corresponding GAM336368 target protein.

The mechanism of the translational inhibition exerted by GAM336368 RNA, herein designated GAM RNA, on one or more GAM336368 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336368 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336368 RNA, herein designated GAM RNA, of

GAM336368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336368 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336368 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336368 RNA correlate with, and may be deduced from, the identity of the GAM336368 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336369 6219 CTGCCTCCCC Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTCAAGCTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTAAGGACG Messenger 336369 (GAM336369) oligonucleotides modulates expression of respective target

CAAAGAGGGC genes whose function and utility is known in the art.

AAGGCCACGA GAM336369 is a novel bioinformatically detectable regulatory, non protein

AGGACTCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336369 was detected

CTGGCCCATC is described with additional reference to Figs. 9-15.

GTGTCCCTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTGCCCCAG encoded by the human genome.

TGCCAGAGCC GAM336369 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AG GAM336369 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336369 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336369 precursor RNA is designated SEQ ID:6219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6219 is located from position 11451765 to position 11451866 relative to chromosome 19 on the `+` strand.

GAM336369 precursor RNA folds onto itself, forming GAM336369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336369 precursor RNA, designated SEQ ID NO: 6219, and a schematic representation of a predicted secondary folding of GAM336369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336369 folded precursor RNA yielding a GAM336369 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336369 RNA, hereby incorporated herein.

GAM336369 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336369 target RNA, herein designated GAM TARGET RNA.

GAM336369 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336369 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336369 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336369 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336369 RNA, herein designated GAM RNA, to target binding sites on GAM336369 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336369 target RNA into GAM336369 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336369 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336369 target genes. The mRNA of each one of this plurality of GAM336369 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336369 RNA, herein designated GAM RNA, and which when bound by GAM336369 RNA causes inhibition of translation of the GAM336369 target mRNA into a corresponding GAM336369 target protein.

The mechanism of the translational inhibition exerted by GAM336369 RNA, herein designated GAM RNA, on one or more GAM336369 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336369 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336369 RNA, herein designated GAM RNA, of GAM336369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336369 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336369 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336369 RNA correlate with, and may be deduced from, the identity of the GAM336369 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336372 6271 CTTTCTCTCG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGAATGGAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTTTTCTTC Messenger 336372 (GAM336372) oligonucleotides modulates expression of respective target
AGAGCCTTTG genes whose function and utility is known in the art.

CTCTGAAACA GAM336372 is a novel bioinformatically detectable regulatory, non protein
TCACGCTCCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336372 was detected
CTGTATGGGG is described with additional reference to Figs. 9-15.

AGAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336372 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336372 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336372 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336372 precursor RNA is designated SEQ ID:6271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6271 is located from position 11647684 to position 11647758 relative to chromosome 10 on the `-` strand.

GAM336372 precursor RNA folds onto itself, forming GAM336372 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336372 precursor RNA, designated SEQ ID NO: 6271, and a schematic representation of a predicted secondary folding of GAM336372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336372 folded precursor RNA yielding a GAM336372 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336372 RNA, hereby incorporated herein.

GAM336372 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336372 target RNA, herein designated GAM TARGET RNA.

GAM336372 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336372 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336372 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336372 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336372 RNA, herein designated GAM RNA, to target binding sites on GAM336372 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336372 target RNA into GAM336372 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336372 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336372 target genes. The mRNA of each one of this plurality of GAM336372 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336372 RNA,

herein designated GAM RNA, and which when bound by GAM336372 RNA causes inhibition of translation of the GAM336372 target mRNA into a corresponding GAM336372 target protein.

The mechanism of the translational inhibition exerted by GAM336372 RNA, herein designated GAM RNA, on one or more GAM336372 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336372 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336372 RNA, herein designated GAM RNA, of GAM336372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336372 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336372 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336372 RNA correlate with, and may be deduced from, the identity of the GAM336372 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336373 7143 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 336373 (GAM336373) oligonucleotides modulates expression of respective target

GCGGAGGTCG genes whose function and utility is known in the art.

TGGTGAGCCA GAM336373 is a novel bioinformatically detectable regulatory, non protein

AAATCGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336373 was detected

ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGAGTGA encoded by the human genome.

AACTCTGTCT GAM336373 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM336373 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336373 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336373 precursor RNA is designated SEQ ID:7143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7143 is located from position 11686899 to position 11687000 relative to chromosome 1 on the `-` strand.

GAM336373 precursor RNA folds onto itself, forming GAM336373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336373 precursor RNA, designated SEQ ID NO: 7143, and a schematic representation of a predicted secondary folding of GAM336373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336373 folded precursor RNA yielding a GAM336373 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336373 RNA, hereby incorporated herein. Expression of GAM336373 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336373 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336373 target RNA, herein designated GAM TARGET RNA.

GAM336373 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336373 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336373 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336373 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336373 RNA, herein designated GAM RNA, to target binding sites on GAM336373 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336373 target RNA into GAM336373 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336373 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336373 target genes. The mRNA of each one of this plurality of GAM336373 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336373 RNA, herein designated GAM RNA, and which when bound by GAM336373 RNA causes inhibition of translation of the GAM336373 target mRNA into a corresponding GAM336373 target protein.

The mechanism of the translational inhibition exerted by GAM336373 RNA, herein designated GAM RNA, on one or more GAM336373 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336373 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336373 RNA, herein designated GAM RNA, of GAM336373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336373 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336373 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336373 RNA correlate with, and may be deduced from, the identity of the GAM336373 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336374 6396 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CGGAGGTCGT genes whose function and utility is known in the art.

GGTGAGCCAA GAM336374 is a novel bioinformatically detectable regulatory, non protein

AATCGCACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336374 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGAGTGAA encoded by the human genome.

ACTCTGTCTC GAM336374 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336374 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336374 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336374 precursor RNA is designated SEQ ID:6396, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6396 is located from position 11686900 to position 11686999 relative to chromosome 1 on the `-` strand.

GAM336374 precursor RNA folds onto itself, forming GAM336374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336374 precursor RNA, designated SEQ ID NO: 6396, and a schematic representation of a predicted secondary folding of GAM336374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336374 folded precursor RNA yielding a GAM336374 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336374 RNA, hereby incorporated herein. Expression of GAM336374 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336374 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336374 target RNA, herein designated GAM TARGET RNA.

GAM336374 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336374 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336374 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336374 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336374 RNA, herein designated GAM RNA, to target binding sites on GAM336374 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336374 target RNA into GAM336374 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336374 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336374 target genes. The mRNA of each one of this plurality of GAM336374 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336374 RNA, herein designated GAM RNA, and which when bound by GAM336374 RNA causes inhibition of translation of the GAM336374 target mRNA into a corresponding GAM336374 target protein.

The mechanism of the translational inhibition exerted by GAM336374 RNA, herein designated GAM RNA, on one or more GAM336374 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336374 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336374 RNA, herein designated GAM RNA, of GAM336374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336374 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336374 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336374 RNA correlate with, and may be deduced from, the identity of the GAM336374 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336375 5969 ATGCATGGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATGTTCAGA encoded by the human genome.

GAATCACCAC GAM336375 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CAGACACTCC GAM336375 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CGTGTGAAAA GAM336375 precursor RNA does not encode a protein. A nucleotide sequence identical or

TTTGTATGCA highly similar to the nucleotide sequence of GAM336375 precursor RNA is designated SEQ

T ID:5969, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5969 is located from position 11850038 to position 11850168 relative to chromosome 19 on the `+` strand.

GAM336375 precursor RNA folds onto itself, forming GAM336375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336375 precursor RNA, designated SEQ ID NO: 5969, and a schematic representation of a predicted secondary folding of GAM336375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336375 folded precursor RNA yielding a GAM336375 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336375 RNA, hereby incorporated herein.

GAM336375 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336375 target RNA, herein designated GAM TARGET RNA.

GAM336375 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336375 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336375 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336375 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336375 RNA, herein designated GAM RNA, to target binding sites on GAM336375 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336375 target RNA into GAM336375 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336375 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336375 target genes. The mRNA of each one of this plurality of GAM336375 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336375 RNA, herein designated GAM RNA, and which when bound by GAM336375 RNA causes inhibition of translation of the GAM336375 target mRNA into a corresponding GAM336375 target protein.

The mechanism of the translational inhibition exerted by GAM336375 RNA, herein designated GAM RNA, on one or more GAM336375 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336375 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336375 RNA, herein designated GAM RNA, of GAM336375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336375 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336375 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336375 RNA correlate with, and may be deduced from, the identity of the GAM336375 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336376 (GAM336376) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336376 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336376 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336376 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336376 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336376 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336376 precursor RNA is designated SEQ ID:6232, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6232 is located from position 11968201 to position 11968285 relative to chromosome 16 on the `-` strand.

GAM336376 precursor RNA folds onto itself, forming GAM336376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336376 precursor RNA, designated SEQ ID NO: 6232, and a schematic representation of a predicted secondary folding of GAM336376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336376 folded precursor RNA yielding a GAM336376 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336376 RNA, hereby incorporated herein.

GAM336376 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336376 target RNA, herein designated GAM TARGET RNA.

GAM336376 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336376 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336376 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336376 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336376 RNA, herein designated GAM RNA, to target binding sites on GAM336376 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336376 target RNA into GAM336376 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336376 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336376 target genes. The mRNA of each one of this plurality of GAM336376 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336376 RNA, herein designated GAM RNA, and which when bound by GAM336376 RNA causes inhibition of translation of the GAM336376 target mRNA into a corresponding GAM336376 target protein.

The mechanism of the translational inhibition exerted by GAM336376 RNA, herein designated GAM RNA, on one or more GAM336376 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336376 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336376 RNA, herein designated GAM RNA, of GAM336376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336376 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336376 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336376 RNA correlate with, and may be deduced from, the identity of the GAM336376 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336377 7269 TGTGAGCCAC Fig. 8 further provides a conceptual description of another novel bioinformatically
CGCGCCTGGC detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCAAATTGT Messenger 336377 (GAM336377) oligonucleotides modulates expression of respective target
TTTTGAAGTA genes whose function and utility is known in the art.

GTTAGGTTGT GAM336377 is a novel bioinformatically detectable regulatory, non protein
AGCTCATA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336377 was detected
is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336377 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336377 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336377 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336377 precursor RNA is designated SEQ ID:7269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7269 is located from position 11968215 to position 11968272 relative to chromosome 16 on the `-` strand.

GAM336377 precursor RNA folds onto itself, forming GAM336377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336377 precursor RNA, designated SEQ ID NO: 7269, and a schematic representation of a predicted secondary folding of GAM336377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336377 folded precursor RNA yielding a GAM336377 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336377 RNA, hereby incorporated herein.

GAM336377 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336377 target RNA, herein designated GAM TARGET RNA.

GAM336377 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336377 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336377 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336377 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336377 RNA, herein designated GAM RNA, to target binding sites on GAM336377 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336377 target RNA into GAM336377 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336377 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336377 target genes. The mRNA of each one of this plurality of GAM336377 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336377 RNA, herein designated GAM RNA, and which when bound by GAM336377 RNA causes inhibition of translation of the GAM336377 target mRNA into a corresponding GAM336377 target protein.

The mechanism of the translational inhibition exerted by GAM336377 RNA, herein designated GAM RNA, on one or more GAM336377 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336377 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336377 RNA, herein designated GAM RNA, of GAM336377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336377 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336377 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336377 RNA correlate with, and may be deduced from, the identity of the GAM336377 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336378 5840 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336378 (GAM336378) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336378 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336378 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336378 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336378 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336378 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336378 precursor RNA is designated SEQ ID:5840, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5840 is located from position 12026100 to position 12026181 relative to chromosome 17 on the `+` strand.

GAM336378 precursor RNA folds onto itself, forming GAM336378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336378 precursor RNA, designated SEQ ID NO: 5840, and a schematic representation of a predicted secondary folding of GAM336378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336378 folded precursor RNA yielding a GAM336378 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336378 RNA, hereby incorporated herein.

GAM336378 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336378 target RNA, herein designated GAM TARGET RNA.

GAM336378 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336378 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336378 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336378 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336378 RNA, herein designated GAM RNA, to target binding sites on GAM336378 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336378 target RNA into GAM336378 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336378 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336378 target genes. The mRNA of each one of this plurality of GAM336378 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336378 RNA, herein designated GAM RNA, and which when bound by GAM336378 RNA causes inhibition of translation of the GAM336378 target mRNA into a corresponding GAM336378 target protein.

The mechanism of the translational inhibition exerted by GAM336378 RNA, herein designated GAM RNA, on one or more GAM336378 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336378 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336378 RNA, herein designated GAM RNA, of GAM336378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336378 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336378 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336378 RNA correlate with, and may be deduced from, the identity of the GAM336378 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

encoded by the human genome.

GAM336381 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336381 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336381 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336381 precursor RNA is designated SEQ ID:6474, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6474 is located from position 12103394 to position 12103469 relative to chromosome 16 on the `+` strand.

GAM336381 precursor RNA folds onto itself, forming GAM336381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336381 precursor RNA, designated SEQ ID NO: 6474, and a schematic representation of a predicted secondary folding of GAM336381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336381 folded precursor RNA yielding a GAM336381 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336381 RNA, hereby incorporated herein.

GAM336381 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336381 target RNA, herein designated GAM TARGET RNA.

GAM336381 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336381 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336381 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336381 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336381 RNA, herein designated GAM RNA, to target binding sites on GAM336381 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336381 target RNA into GAM336381 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336381 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336381 target genes. The mRNA of each one of this plurality of GAM336381 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336381 RNA, herein designated GAM RNA, and which when bound by GAM336381 RNA causes inhibition of translation of the GAM336381 target mRNA into a corresponding GAM336381 target protein.

The mechanism of the translational inhibition exerted by GAM336381 RNA, herein designated GAM RNA, on one or more GAM336381 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336381 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336381 RNA, herein designated GAM RNA, of GAM336381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336381 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336381 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336381 RNA correlate with, and may be deduced from, the identity of the GAM336381 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336382 6617 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACTCGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGGAGG Messenger 336382 (GAM336382) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGATCCC GAM336382 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336382 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GTGACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM336382 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336382 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336382 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336382 precursor RNA is designated SEQ ID:6617, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6617 is located from position 12118809 to position 12118896 relative to chromosome 16 on the `-` strand.

GAM336382 precursor RNA folds onto itself, forming GAM336382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336382 precursor RNA, designated SEQ ID NO: 6617, and a schematic representation of a predicted secondary folding of GAM336382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336382 folded precursor RNA yielding a GAM336382 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336382 RNA, hereby incorporated herein.

GAM336382 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336382 target RNA, herein designated GAM TARGET RNA.

GAM336382 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336382 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336382 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336382 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336382 RNA, herein designated GAM RNA, to target binding sites on GAM336382 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336382 target RNA into GAM336382 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336382 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336382 target genes. The mRNA of each one of this plurality of GAM336382 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336382 RNA, herein designated GAM RNA, and which when bound by GAM336382 RNA causes inhibition of translation of the GAM336382 target mRNA into a corresponding GAM336382 target protein.

The mechanism of the translational inhibition exerted by GAM336382 RNA, herein designated GAM RNA, on one or more GAM336382 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336382 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336382 RNA, herein designated GAM RNA, of GAM336382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336382 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336382 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336382 RNA correlate with, and may be deduced from, the identity of the GAM336382 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336384 7341 TTGTTGATTC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATATCCCTAT Messenger 336384 (GAM336384) oligonucleotides modulates expression of respective target
GATGTCCCTG genes whose function and utility is known in the art.

GGAAGCGATG GAM336384 is a novel bioinformatically detectable regulatory, non protein
GGGCATTCCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336384 was detected
AGTCATCTGG is described with additional reference to Figs. 9-15.

GATGTGCAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTCTAAATAT encoded by the human genome.

TATCAATGG GAM336384 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336384 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336384 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336384 precursor RNA is designated SEQ ID:7341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7341 is located from position 12348835 to position 12348933 relative to chromosome 20 on the `-` strand.

GAM336384 precursor RNA folds onto itself, forming GAM336384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336384 precursor RNA, designated SEQ ID NO: 7341, and a schematic representation of a predicted secondary folding of GAM336384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336384 folded precursor RNA yielding a GAM336384 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336384 RNA, hereby incorporated herein.

GAM336384 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336384 target RNA, herein designated GAM TARGET RNA.

GAM336384 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336384 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336384 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336384 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336384 RNA, herein designated GAM RNA, to target binding sites on GAM336384 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336384 target RNA into GAM336384 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336384 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336384 target genes. The mRNA of each one of this plurality of GAM336384 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336384 RNA, herein designated GAM RNA, and which when bound by GAM336384 RNA causes inhibition of translation of the GAM336384 target mRNA into a corresponding GAM336384 target protein.

The mechanism of the translational inhibition exerted by GAM336384 RNA, herein designated GAM RNA, on one or more GAM336384 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336384 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336384 RNA, herein designated GAM RNA, of GAM336384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336384 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336384 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336384 RNA correlate with, and may be deduced from, the identity of the GAM336384 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336385 (GAM336385) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336385 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336385 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336385 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336385 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336385 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336385 precursor RNA is designated SEQ ID:6478, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6478 is located from position 12348840 to position 12348928 relative to chromosome 20 on the `-` strand.

GAM336385 precursor RNA folds onto itself, forming GAM336385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336385 precursor RNA, designated SEQ ID NO: 6478, and a schematic representation of a predicted secondary folding of GAM336385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336385 folded precursor RNA yielding a GAM336385 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336385 RNA, hereby incorporated herein.

GAM336385 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336385 target RNA, herein designated GAM TARGET RNA.

GAM336385 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336385 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336385 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336385 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336385 RNA, herein designated GAM RNA, to target binding sites on GAM336385 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336385 target RNA into GAM336385 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336385 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336385 target genes. The mRNA of each one of this plurality of GAM336385 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336385 RNA, herein designated GAM RNA, and which when bound by GAM336385 RNA causes inhibition of translation of the GAM336385 target mRNA into a corresponding GAM336385 target protein.

The mechanism of the translational inhibition exerted by GAM336385 RNA, herein designated GAM RNA, on one or more GAM336385 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336385 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336385 RNA, herein designated GAM RNA, of GAM336385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336385 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336385 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336385 RNA correlate with, and may be deduced from, the identity of the GAM336385 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGAAGATACA is described with additional reference to Figs. 9-15.

GGGTTGTCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTTGACACAT encoded by the human genome.

GT GAM336386 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336386 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336386 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336386 precursor RNA is designated SEQ ID:5680, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5680 is located from position 12401666 to position 12401757 relative to chromosome 16 on the `+` strand.

GAM336386 precursor RNA folds onto itself, forming GAM336386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336386 precursor RNA, designated SEQ ID NO: 5680, and a schematic representation of a predicted secondary folding of GAM336386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336386 folded precursor RNA yielding a GAM336386 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336386 RNA, hereby incorporated herein.

GAM336386 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336386 target RNA, herein designated GAM TARGET RNA.

GAM336386 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336386 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336386 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336386 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336386 RNA, herein designated GAM RNA, to target binding sites on GAM336386 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336386 target RNA into GAM336386 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336386 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336386 target genes. The mRNA of each one of this plurality of GAM336386 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336386 RNA, herein designated GAM RNA, and which when bound by GAM336386 RNA causes inhibition of translation of the GAM336386 target mRNA into a corresponding GAM336386 target protein.

The mechanism of the translational inhibition exerted by GAM336386 RNA, herein designated GAM RNA, on one or more GAM336386 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336386 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336386 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336386 RNA, herein designated GAM RNA, of GAM336386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336386 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336386 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336386 RNA correlate with, and may be deduced from, the identity of the GAM336386 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GCACTGTAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336387 was detected
CTCCTGGGTG is described with additional reference to Figs. 9-15.

ACAGAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336387 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336387 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336387 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336387 precursor RNA is designated SEQ ID:7324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7324 is located from position 12619567 to position 12619645 relative to chromosome X on the `+` strand.

GAM336387 precursor RNA folds onto itself, forming GAM336387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336387 precursor RNA, designated SEQ ID NO: 7324, and a schematic representation of a predicted secondary folding of GAM336387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336387 folded precursor RNA yielding a GAM336387 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336387 RNA, hereby incorporated herein.

GAM336387 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336387 target RNA, herein designated GAM TARGET RNA.

GAM336387 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336387 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336387 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336387 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336387 RNA, herein designated GAM RNA, to target binding sites on GAM336387 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336387 target RNA into GAM336387 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336387 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336387 target genes. The mRNA of each one of this plurality of GAM336387 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336387 RNA, herein designated GAM RNA, and which when bound by GAM336387 RNA causes inhibition of translation of the GAM336387 target mRNA into a corresponding GAM336387 target protein.

The mechanism of the translational inhibition exerted by GAM336387 RNA, herein

designated GAM RNA, on one or more GAM336387 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336387 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336387 RNA, herein designated GAM RNA, of GAM336387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336387 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336387 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336387 RNA correlate with, and may be deduced from, the identity of the GAM336387 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336388 6938 GTTCCTCTTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCATTGGCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGTGCTCTG Messenger 336388 (GAM336388) oligonucleotides modulates expression of respective target

TGGCATCTGT genes whose function and utility is known in the art.

CACAGGTTTT GAM336388 is a novel bioinformatically detectable regulatory, non protein

AATTGAAGGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336388 was detected

CAGCAGTGGC is described with additional reference to Figs. 9-15.

AGGTAAGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCAGCATCAT encoded by the human genome.

CAGCTTCTTT GAM336388 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CAGCCTTTTG GAM336388 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAAC GAM336388 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336388 precursor RNA is designated SEQ ID:6938, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6938 is located from position 12778141 to position 12778254 relative to chromosome 10 on the `+` strand.

GAM336388 precursor RNA folds onto itself, forming GAM336388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336388 precursor RNA, designated SEQ ID NO: 6938, and a schematic representation of a predicted secondary folding of GAM336388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336388 folded precursor RNA yielding a GAM336388 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336388 RNA, hereby incorporated herein.

GAM336388 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336388 target RNA, herein designated GAM TARGET RNA.

GAM336388 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336388 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336388 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336388 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336388 RNA, herein designated GAM RNA, to target binding sites on GAM336388 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336388 target RNA into GAM336388 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336388 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336388 target genes. The mRNA of each one of this plurality of GAM336388 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336388 RNA, herein designated GAM RNA, and which when bound by GAM336388 RNA causes inhibition of translation of the GAM336388 target mRNA into a corresponding GAM336388 target protein.

The mechanism of the translational inhibition exerted by GAM336388 RNA, herein designated GAM RNA, on one or more GAM336388 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336388 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336388 RNA, herein designated GAM RNA, of GAM336388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336388 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336388 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336388 RNA correlate with, and may be deduced from, the identity of the GAM336388 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336389 6763 GGCTGATGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCTGTGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTGTCACAG Messenger 336389 (GAM336389) oligonucleotides modulates expression of respective target

GTTTTAATTG genes whose function and utility is known in the art.

AAGGTCAGCA GAM336389 is a novel bioinformatically detectable regulatory, non protein

GTGGCAGGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336389 was detected

AGCCACCAGC is described with additional reference to Figs. 9-15.

ATCATCAGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336389 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336389 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336389 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336389 precursor RNA is designated SEQ ID:6763, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6763 is located from position 12778156 to position 12778235 relative to chromosome 10 on the `+` strand.

GAM336389 precursor RNA folds onto itself, forming GAM336389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336389 precursor RNA, designated SEQ ID NO: 6763, and a schematic representation of a predicted secondary folding of GAM336389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336389 folded precursor RNA yielding a GAM336389 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336389 RNA, hereby incorporated herein.

GAM336389 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336389 target RNA, herein designated GAM TARGET RNA.

GAM336389 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336389 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336389 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336389 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336389 RNA, herein designated GAM RNA, to target binding sites on GAM336389 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336389 target RNA into GAM336389 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336389 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336389 target genes. The mRNA of each one of this plurality of GAM336389 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336389 RNA, herein designated GAM RNA, and which when bound by GAM336389 RNA causes inhibition of translation of the GAM336389 target mRNA into a corresponding GAM336389 target protein.

The mechanism of the translational inhibition exerted by GAM336389 RNA, herein designated GAM RNA, on one or more GAM336389 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336389 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336389 RNA, herein designated GAM RNA, of GAM336389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336389 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336389 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336389 RNA correlate with, and may be deduced from, the identity of the GAM336389 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336390 7112 TGAGGCAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCTCTTA detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 336390 (GAM336390) oligonucleotides modulates expression of respective target

GCGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336390 is a novel bioinformatically detectable regulatory, non protein

AGATTGCGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336390 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGCGAG encoded by the human genome.

ACTCCGTTTC GAM336390 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336390 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336390 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336390 precursor RNA is designated SEQ ID:7112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7112 is located from position 12791804 to position 12791904 relative to chromosome 19 on the `-` strand.

GAM336390 precursor RNA folds onto itself, forming GAM336390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336390 precursor RNA, designated SEQ ID NO: 7112, and a schematic representation of a predicted secondary folding of GAM336390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336390 folded precursor RNA yielding a GAM336390 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336390 RNA, hereby incorporated herein. Expression of GAM336390 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336390 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336390 target RNA, herein designated GAM TARGET RNA.

GAM336390 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336390 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336390 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336390 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336390 RNA, herein designated GAM RNA, to target binding sites on GAM336390 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336390 target RNA into GAM336390 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336390 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336390 target genes. The mRNA of each one of this plurality of GAM336390 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336390 RNA, herein designated GAM RNA, and which when bound by GAM336390 RNA causes inhibition of translation of the GAM336390 target mRNA into a corresponding GAM336390 target protein.

The mechanism of the translational inhibition exerted by GAM336390 RNA, herein designated GAM RNA, on one or more GAM336390 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336390 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336390 RNA, herein designated GAM RNA, of GAM336390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336390 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336390 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336390 RNA correlate with, and may be deduced from, the identity of the GAM336390 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336392 RNA, herein designated GAM RNA, to target binding sites on GAM336392 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336392 target RNA into GAM336392 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336392 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336392 target genes. The mRNA of each one of this plurality of GAM336392 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336392 RNA, herein designated GAM RNA, and which when bound by GAM336392 RNA causes inhibition of translation of the GAM336392 target mRNA into a corresponding GAM336392 target protein.

The mechanism of the translational inhibition exerted by GAM336392 RNA, herein designated GAM RNA, on one or more GAM336392 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336392 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336392 RNA, herein designated GAM RNA, of GAM336392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336392 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336392 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336392 RNA correlate with, and may be deduced from, the identity of the GAM336392 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336393 7079 TCTTTCACTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCACATC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCAGCTCCT Messenger 336393 (GAM336393) oligonucleotides modulates expression of respective target

CCCCCTCCGC genes whose function and utility is known in the art.

CCTCCCTCAG GAM336393 is a novel bioinformatically detectable regulatory, non protein

GCTTAGACCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336393 was detected

TGGAGCTGTA is described with additional reference to Figs. 9-15.

ACAGATCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTTCGTGTG encoded by the human genome.

AGA GAM336393 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336393 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336393 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336393 precursor RNA is designated SEQ ID:7079, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7079 is located from position 12833782 to position 12833874 relative to chromosome 17 on the `+` strand.

GAM336393 precursor RNA folds onto itself, forming GAM336393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336393 precursor RNA, designated SEQ ID NO: 7079, and a schematic representation of a predicted secondary folding of GAM336393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336393 folded precursor RNA yielding a GAM336393 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336393 RNA, hereby incorporated herein.

GAM336393 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336393 target RNA, herein designated GAM TARGET RNA.

GAM336393 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336393 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336393 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336393 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336393 RNA, herein designated GAM RNA, to target binding sites on GAM336393 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336393 target RNA into GAM336393 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336393 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336393 target genes. The mRNA of each one of this plurality of GAM336393 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336393 RNA, herein designated GAM RNA, and which when bound by GAM336393 RNA causes inhibition of translation of the GAM336393 target mRNA into a corresponding GAM336393 target protein.

The mechanism of the translational inhibition exerted by GAM336393 RNA, herein designated GAM RNA, on one or more GAM336393 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336393 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336393 RNA, herein designated GAM RNA, of GAM336393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336393 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336393 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336393 RNA correlate with, and may be deduced from, the identity of the GAM336393 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336394 6214 CTGCCAGCCG Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTGTCTCTA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGTTTTTCC Messenger 336394 (GAM336394) oligonucleotides modulates expression of respective target

AAATGACATC genes whose function and utility is known in the art.

CAGGGCTCTG GAM336394 is a novel bioinformatically detectable regulatory, non protein

GCCGTGGAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336394 was detected

CCCTGATGTG is described with additional reference to Figs. 9-15.

ATCGCTAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACCTCCGGA encoded by the human genome.

GAGGGGCTCG GAM336394 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CAG GAM336394 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336394 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336394 precursor RNA is designated SEQ

ID:6214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6214 is located from position 12908963 to position 12909065 relative to chromosome 8 on the `+` strand.

GAM336394 precursor RNA folds onto itself, forming GAM336394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336394 precursor RNA, designated SEQ ID NO: 6214, and a schematic representation of a predicted secondary folding of GAM336394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336394 folded precursor RNA yielding a GAM336394 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336394 RNA, hereby incorporated herein.

GAM336394 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336394 target RNA, herein designated GAM TARGET RNA.

GAM336394 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336394 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336394 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336394 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336394 RNA, herein designated GAM RNA, to target binding sites on GAM336394 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336394 target RNA into GAM336394 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336394 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336394 target genes. The mRNA of each one of this plurality of GAM336394 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336394 RNA, herein designated GAM RNA, and which when bound by GAM336394 RNA causes inhibition of translation of the GAM336394 target mRNA into a corresponding GAM336394 target protein.

The mechanism of the translational inhibition exerted by GAM336394 RNA, herein designated GAM RNA, on one or more GAM336394 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336394 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336394 RNA, herein designated GAM RNA, of GAM336394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336394 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336394 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336394 RNA correlate with, and may be deduced from, the identity of the GAM336394 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336395 6891 GTCTGTCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGTTTTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

CAAATGACAT Messenger 336395 (GAM336395) oligonucleotides modulates expression of respective target

CCAGGGCTCT genes whose function and utility is known in the art.

GGCCGTGGAG GAM336395 is a novel bioinformatically detectable regulatory, non protein

TCCCTGATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336395 was detected

GATCGCTAAA is described with additional reference to Figs. 9-15.

GGACCTCCGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGGGGC encoded by the human genome.

GAM336395 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336395 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336395 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336395 precursor RNA is designated SEQ ID:6891, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6891 is located from position 12908972 to position 12909059 relative to chromosome 8 on the `+` strand.

GAM336395 precursor RNA folds onto itself, forming GAM336395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336395 precursor RNA, designated SEQ ID NO: 6891, and a schematic representation of a predicted secondary folding of GAM336395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336395 folded precursor RNA yielding a GAM336395 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336395 RNA, hereby incorporated herein.

GAM336395 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336395 target RNA, herein designated GAM TARGET RNA.

GAM336395 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336395 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336395 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336395 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336395 RNA, herein designated GAM RNA, to target binding sites on GAM336395 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336395 target RNA into GAM336395 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336395 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336395 target genes. The mRNA of each one of this plurality of GAM336395 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336395 RNA, herein designated GAM RNA, and which when bound by GAM336395 RNA causes inhibition of translation of the GAM336395 target mRNA into a corresponding GAM336395 target protein.

The mechanism of the translational inhibition exerted by GAM336395 RNA, herein designated GAM RNA, on one or more GAM336395 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336395 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336395 RNA, herein designated GAM RNA, of GAM336395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336395 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336395 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336395 RNA correlate with, and may be deduced from, the identity of the GAM336395 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336397 6520 GCGTTCCTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAAACCATT detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGATTTCAT Messenger 336397 (GAM336397) oligonucleotides modulates expression of respective target

TCTCCTTCCT genes whose function and utility is known in the art.

TTCTCTGACA GAM336397 is a novel bioinformatically detectable regulatory, non protein
GAAGCTGCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336397 was detected
GTGAGGAAGG is described with additional reference to Figs. 9-15.

TAATGATCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATCAAACCA encoded by the human genome.

TCCCCAGAAT GAM336397 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GC GAM336397 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336397 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336397 precursor RNA is designated SEQ ID:6520, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6520 is located from position 13120513 to position 13120614 relative to chromosome 16 on the `+` strand.

GAM336397 precursor RNA folds onto itself, forming GAM336397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336397 precursor RNA, designated SEQ ID NO: 6520, and a schematic representation of a predicted secondary folding of GAM336397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336397 folded precursor RNA yielding a GAM336397 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336397 RNA, hereby incorporated herein.

GAM336397 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336397 target RNA, herein designated GAM TARGET RNA.

GAM336397 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336397 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336397 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336397 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336397 RNA, herein designated GAM RNA, to target binding sites on GAM336397 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336397 target RNA into GAM336397 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336397 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336397 target genes. The mRNA of each one of this plurality of GAM336397 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336397 RNA, herein designated GAM RNA, and which when bound by GAM336397 RNA causes inhibition of translation of the GAM336397 target mRNA into a corresponding GAM336397 target protein.

The mechanism of the translational inhibition exerted by GAM336397 RNA, herein designated GAM RNA, on one or more GAM336397 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336397 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336397 RNA, herein designated GAM RNA, of GAM336397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336397 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336397 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336397 RNA correlate with, and may be deduced from, the identity of the GAM336397 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336399 6044 CATTTTAGTA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCCTGCATCT encoded by the human genome.

ATCTCCTGCT GAM336399 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GTAGCATCAC GAM336399 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAAGGTG GAM336399 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336399 precursor RNA is designated SEQ ID:6044, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6044 is located from position 13641031 to position 13641147 relative to chromosome 18 on the `+` strand.

GAM336399 precursor RNA folds onto itself, forming GAM336399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336399 precursor RNA, designated SEQ ID NO: 6044, and a schematic representation of a predicted secondary folding of GAM336399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336399 folded precursor RNA yielding a GAM336399 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336399 RNA, hereby incorporated herein.

GAM336399 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336399 target RNA, herein designated GAM TARGET RNA.

GAM336399 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336399 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336399 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336399 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336399 RNA, herein designated GAM RNA, to target binding sites on GAM336399 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336399 target RNA into GAM336399 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336399 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336399 target genes. The mRNA of each one of this plurality of GAM336399 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336399 RNA, herein designated GAM RNA, and which when bound by GAM336399 RNA causes inhibition of translation of the GAM336399 target mRNA into a corresponding GAM336399 target protein.

The mechanism of the translational inhibition exerted by GAM336399 RNA, herein designated GAM RNA, on one or more GAM336399 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336399 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336399 RNA, herein designated GAM RNA, of GAM336399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336399 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336399 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336399 RNA correlate with, and may be deduced from, the identity of the GAM336399 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336400 5841 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336400 (GAM336400) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336400 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336400 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336400 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336400 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336400 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336400 precursor RNA is designated SEQ ID:5841, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5841 is located from position 13789635 to position 13789716 relative to chromosome 3 on the `+` strand.

GAM336400 precursor RNA folds onto itself, forming GAM336400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336400 precursor RNA, designated SEQ ID NO: 5841, and a schematic representation of a predicted secondary folding of GAM336400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336400 folded precursor RNA yielding a GAM336400 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336400 RNA, hereby incorporated herein.

GAM336400 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336400 target RNA, herein designated GAM TARGET RNA.

GAM336400 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336400 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336400 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336400 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336400 RNA, herein designated GAM RNA, to target binding sites on GAM336400 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336400 target RNA into GAM336400 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336400 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336400 target genes. The mRNA of each one of this plurality of GAM336400 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336400 RNA, herein designated GAM RNA, and which when bound by GAM336400 RNA causes inhibition of translation of the GAM336400 target mRNA into a corresponding GAM336400 target protein.

The mechanism of the translational inhibition exerted by GAM336400 RNA, herein designated GAM RNA, on one or more GAM336400 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336400 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336400 RNA, herein designated GAM RNA, of GAM336400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336400 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336400 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336400 RNA correlate with, and may be deduced from, the identity of the GAM336400 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336403 6267 CTTGCCATGC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGCCCTTTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGGAGCAAG Messenger 336403 (GAM336403) oligonucleotides modulates expression of respective target

TCACAATACA genes whose function and utility is known in the art.

GCAGCTTGCT GAM336403 is a novel bioinformatically detectable regulatory, non protein

TCATTAGGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336403 was detected

AAGCAAGCAA is described with additional reference to Figs. 9-15.

G GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336403 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336403 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336403 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336403 precursor RNA is designated SEQ ID:6267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6267 is located from position 14113783 to position 14113853 relative to chromosome Y on the `+` strand.

GAM336403 precursor RNA folds onto itself, forming GAM336403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336403 precursor RNA, designated SEQ ID NO: 6267, and a schematic representation of a predicted secondary folding of GAM336403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336403 folded precursor RNA yielding a GAM336403 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336403 RNA, hereby incorporated herein.

GAM336403 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336403 target RNA, herein designated GAM TARGET RNA.

GAM336403 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336403 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336403 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336403 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336403 RNA, herein designated GAM RNA, to target binding sites on GAM336403 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336403 target RNA into GAM336403 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336403 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336403 target genes. The mRNA of each one of this plurality of GAM336403 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336403 RNA, herein designated GAM RNA, and which when bound by GAM336403 RNA causes inhibition of translation of the GAM336403 target mRNA into a corresponding GAM336403 target protein.

The mechanism of the translational inhibition exerted by GAM336403 RNA, herein designated GAM RNA, on one or more GAM336403 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336403 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336403 RNA, herein designated GAM RNA, of GAM336403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336403 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336403 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336403 RNA correlate with, and may be deduced from, the identity of the GAM336403 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336404 6841 GGTGAAACTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCTTTCCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTGTTCTAT Messenger 336404 (GAM336404) oligonucleotides modulates expression of respective target

GAGTGTGATG genes whose function and utility is known in the art.

GTGTTTGAGA GAM336404 is a novel bioinformatically detectable regulatory, non protein

AAATGTGGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336404 was detected

CTATGGTTCA is described with additional reference to Figs. 9-15.

GGCGCACTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACATGTGCAA encoded by the human genome.

AGATGGAGAA GAM336404 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AGCACTCACC GAM336404 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336404 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336404 precursor RNA is designated SEQ ID:6841, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6841 is located from position 14534146 to position 14534255 relative to chromosome 22 on the `-` strand.

GAM336404 precursor RNA folds onto itself, forming GAM336404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336404 precursor RNA, designated SEQ ID NO: 6841, and a schematic representation of a predicted secondary folding of GAM336404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336404 folded precursor RNA yielding a GAM336404 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336404 RNA, hereby incorporated herein.

GAM336404 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336404 target RNA, herein designated GAM TARGET RNA.

GAM336404 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336404 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336404 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336404 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336404 RNA, herein designated GAM RNA, to target binding sites on GAM336404 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336404 target RNA into GAM336404 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336404 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336404 target genes. The mRNA of each one of this plurality of GAM336404 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM336404 RNA, herein designated GAM RNA, and which when bound by GAM336404 RNA causes inhibition of translation of the GAM336404 target mRNA into a corresponding GAM336404 target protein.

The mechanism of the translational inhibition exerted by GAM336404 RNA, herein designated GAM RNA, on one or more GAM336404 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336404 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336404 RNA, herein designated GAM RNA, of GAM336404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336404 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336404 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336404 RNA correlate with, and may be deduced from, the identity of the GAM336404 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336405 7244 TGGGTACTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATCTCACACT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGATTTCTT Messenger 336405 (GAM336405) oligonucleotides modulates expression of respective target

GCTTCGTGGG genes whose function and utility is known in the art.

AAACAGACTG GAM336405 is a novel bioinformatically detectable regulatory, non protein

TAATATTGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336405 was detected

AGCA is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336405 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336405 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336405 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336405 precursor RNA is designated SEQ ID:7244, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7244 is located from position 14872165 to position 14872228 relative to chromosome 18 on the `+` strand.

GAM336405 precursor RNA folds onto itself, forming GAM336405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336405 precursor RNA, designated SEQ ID NO: 7244, and a schematic representation of a predicted secondary folding of GAM336405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336405 folded precursor RNA yielding a GAM336405 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336405 RNA, hereby incorporated herein.

GAM336405 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336405 target RNA, herein designated GAM TARGET RNA.

GAM336405 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336405 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336405 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336405 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336405 RNA, herein designated GAM RNA, to target binding sites on GAM336405 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336405 target RNA

into GAM336405 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336405 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336405 target genes. The mRNA of each one of this plurality of GAM336405 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336405 RNA, herein designated GAM RNA, and which when bound by GAM336405 RNA causes inhibition of translation of the GAM336405 target mRNA into a corresponding GAM336405 target protein.

The mechanism of the translational inhibition exerted by GAM336405 RNA, herein designated GAM RNA, on one or more GAM336405 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336405 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336405 RNA, herein designated GAM RNA, of GAM336405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336405 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336405 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336405 RNA correlate with, and may be deduced from, the identity of the GAM336405 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336406 7271 TGTGCATTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCCAGAGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTGTGAGGA Messenger 336406 (GAM336406) oligonucleotides modulates expression of respective target

GTGTTCAGCT genes whose function and utility is known in the art.

GCTGCAAACA GAM336406 is a novel bioinformatically detectable regulatory, non protein

TCCCATGAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336406 was detected

CCTCAGCTAC is described with additional reference to Figs. 9-15.

TTGGAACAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGTACA encoded by the human genome.

GAM336406 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336406 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336406 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336406 precursor RNA is designated SEQ ID:7271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7271 is located from position 14912408 to position 14912493 relative to chromosome 17 on the `+` strand.

GAM336406 precursor RNA folds onto itself, forming GAM336406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336406 precursor RNA, designated SEQ ID NO: 7271, and a schematic representation of a predicted secondary folding of GAM336406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336406 folded precursor RNA yielding a GAM336406 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336406 RNA, hereby incorporated herein.

GAM336406 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336406 target RNA, herein designated GAM TARGET RNA.

GAM336406 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336406 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336406 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336406 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336406 RNA, herein designated GAM RNA, to target binding sites on GAM336406 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336406 target RNA into GAM336406 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336406 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336406 target genes. The mRNA of each one of this plurality of GAM336406 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336406 RNA, herein designated GAM RNA, and which when bound by GAM336406 RNA causes inhibition of translation of the GAM336406 target mRNA into a corresponding GAM336406 target protein.

The mechanism of the translational inhibition exerted by GAM336406 RNA, herein designated GAM RNA, on one or more GAM336406 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336406 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336406 RNA, herein designated GAM RNA, of GAM336406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336406 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336406 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336406 RNA correlate with, and may be deduced from, the identity of the GAM336406 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336407 6788 GGGAGGACTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTGAGCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAGGTGGAG Messenger 336407 (GAM336407) oligonucleotides modulates expression of respective target

TCTGTAGTGA genes whose function and utility is known in the art.

GCTGTGATCC GAM336407 is a novel bioinformatically detectable regulatory, non protein
TGCCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336407 was detected
CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGACCCTG encoded by the human genome.

CC GAM336407 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336407 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336407 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336407 precursor RNA is designated SEQ ID:6788, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6788 is located from position 15010865 to position 15010956 relative to chromosome 10 on the `-` strand.

GAM336407 precursor RNA folds onto itself, forming GAM336407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336407 precursor RNA, designated SEQ ID NO: 6788, and a schematic representation of a predicted secondary folding of GAM336407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336407 folded precursor RNA yielding a GAM336407 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336407 RNA, hereby incorporated herein. Expression of GAM336407 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336407 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336407 target RNA, herein designated GAM TARGET RNA.

GAM336407 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336407 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336407 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336407 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336407 RNA, herein designated GAM RNA, to target binding sites on GAM336407 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336407 target RNA into GAM336407 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336407 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336407 target genes. The mRNA of each one of this plurality of GAM336407 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336407 RNA, herein designated GAM RNA, and which when bound by GAM336407 RNA causes inhibition of translation of the GAM336407 target mRNA into a corresponding GAM336407 target protein.

The mechanism of the translational inhibition exerted by GAM336407 RNA, herein designated GAM RNA, on one or more GAM336407 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336407 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336407 RNA, herein designated GAM RNA, of GAM336407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336407 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336407 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336407 RNA correlate with, and may be deduced from, the identity of the GAM336407 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336408 6848 GGTGGGAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
CTGCTTGAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
CCAGGAGGTG Messenger 336408 (GAM336408) oligonucleotides modulates expression of respective target
GAGTCTGTAG genes whose function and utility is known in the art.

TGAGCTGTGA GAM336408 is a novel bioinformatically detectable regulatory, non protein
TCCTGCCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336408 was detected
GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGCAAGACC encoded by the human genome.

CTGCC GAM336408 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336408 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336408 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336408 precursor RNA is designated SEQ ID:6848, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6848 is located from position 15010865 to position 15010959 relative to chromosome 10 on the `-` strand.

GAM336408 precursor RNA folds onto itself, forming GAM336408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336408 precursor RNA, designated SEQ ID NO: 6848, and a schematic representation of a predicted secondary folding of GAM336408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336408 folded precursor RNA yielding a GAM336408 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336408 RNA, hereby incorporated herein.

Expression of GAM336408 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336408 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336408 target RNA, herein designated GAM TARGET RNA.

GAM336408 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336408 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336408 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336408 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336408 RNA, herein designated GAM RNA, to target binding sites on GAM336408 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336408 target RNA into GAM336408 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336408 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336408 target genes. The mRNA of each one of this plurality of GAM336408 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336408 RNA, herein designated GAM RNA, and which when bound by GAM336408 RNA causes inhibition of translation of the GAM336408 target mRNA into a corresponding GAM336408 target protein.

The mechanism of the translational inhibition exerted by GAM336408 RNA, herein designated GAM RNA, on one or more GAM336408 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336408 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336408 RNA, herein designated GAM RNA, of GAM336408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336408 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336408 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336408 RNA correlate with, and may be deduced from, the identity of the GAM336408 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336409 (GAM336409) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336409 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336409 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336409 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336409 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336409 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336409 precursor RNA is designated SEQ ID:6598, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6598 is located from position 15010870 to position 15010952 relative to chromosome 10 on the `-` strand.

GAM336409 precursor RNA folds onto itself, forming GAM336409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336409 precursor RNA, designated SEQ ID NO: 6598, and a schematic representation of a predicted secondary folding of GAM336409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336409 folded precursor RNA yielding a GAM336409 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336409 RNA, hereby incorporated herein. Expression of GAM336409 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336409 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336409 target RNA, herein designated GAM TARGET RNA.

GAM336409 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336409 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336409 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336409 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336409 RNA, herein designated GAM RNA, to target binding sites on GAM336409 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336409 target RNA into GAM336409 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336409 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336409 target genes. The mRNA of each one of this plurality of GAM336409 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336409 RNA, herein designated GAM RNA, and which when bound by GAM336409 RNA causes inhibition of translation of the GAM336409 target mRNA into a corresponding GAM336409 target protein.

The mechanism of the translational inhibition exerted by GAM336409 RNA, herein designated GAM RNA, on one or more GAM336409 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336409 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336409 RNA, herein designated GAM RNA, of GAM336409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336409 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336409 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336409 RNA correlate with, and may be deduced from, the identity of the GAM336409 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336412 6117 CCTGAGACAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTTGCCCAG Messenger 336412 (GAM336412) oligonucleotides modulates expression of respective target
GCTGGAGTTT genes whose function and utility is known in the art.

AATGGCACGA GAM336412 is a novel bioinformatically detectable regulatory, non protein
TCTTGGCTTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336412 was detected
CCACAACCTC is described with additional reference to Figs. 9-15.

TGCCTCCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTTCAAGCAA encoded by the human genome.

TTCTCCTGCC GAM336412 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TCAGG GAM336412 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336412 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336412 precursor RNA is designated SEQ ID:6117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6117 is located from position 15155243 to position 15155347 relative to chromosome 9 on the `-` strand.

GAM336412 precursor RNA folds onto itself, forming GAM336412 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336412 precursor RNA, designated SEQ ID NO: 6117, and a schematic representation of a predicted secondary folding of GAM336412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336412 folded precursor RNA yielding a GAM336412 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336412 RNA, hereby incorporated herein.

GAM336412 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336412 target RNA, herein designated GAM TARGET RNA.

GAM336412 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336412 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336412 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336412 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336412 RNA, herein designated GAM RNA, to target binding sites on GAM336412 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336412 target RNA into GAM336412 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336412 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336412 target genes. The mRNA of each one of this plurality of GAM336412 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336412 RNA,

herein designated GAM RNA, and which when bound by GAM336412 RNA causes inhibition of translation of the GAM336412 target mRNA into a corresponding GAM336412 target protein.

The mechanism of the translational inhibition exerted by GAM336412 RNA, herein designated GAM RNA, on one or more GAM336412 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336412 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336412 RNA, herein designated GAM RNA, of GAM336412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336412 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336412 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336412 RNA correlate with, and may be deduced from, the identity of the GAM336412 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGTGAGCCGA GAM336413 is a novel bioinformatically detectable regulatory, non protein

GATGGCGCAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336413 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAATGGAGA encoded by the human genome.

CTCTGTCTC GAM336413 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336413 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336413 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336413 precursor RNA is designated SEQ ID:6383, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6383 is located from position 15476401 to position 15476499 relative to chromosome 16 on the `+` strand.

GAM336413 precursor RNA folds onto itself, forming GAM336413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336413 precursor RNA, designated SEQ ID NO: 6383, and a schematic representation of a predicted secondary folding of GAM336413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336413 folded precursor RNA yielding a GAM336413 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336413 RNA, hereby incorporated herein. Expression of GAM336413 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336413 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336413 target RNA, herein designated GAM TARGET RNA.

GAM336413 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336413 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336413 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336413 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336413 RNA, herein designated GAM RNA, to target binding sites on GAM336413 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336413 target RNA into GAM336413 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336413 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336413 target genes. The mRNA of each one of this plurality of GAM336413 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336413 RNA, herein designated GAM RNA, and which when bound by GAM336413 RNA causes inhibition of translation of the GAM336413 target mRNA into a corresponding GAM336413 target protein.

The mechanism of the translational inhibition exerted by GAM336413 RNA, herein designated GAM RNA, on one or more GAM336413 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336413 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336413 RNA, herein designated GAM RNA, of GAM336413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336413 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336413 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336413 RNA correlate with, and may be deduced from, the identity of the GAM336413 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336414 5754 AGGAAGAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGCTGTGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
GATGAGAGCA Messenger 336414 (GAM336414) oligonucleotides modulates expression of respective target
ACTTGCTTTT genes whose function and utility is known in the art.

TACAATAATT GAM336414 is a novel bioinformatically detectable regulatory, non protein
ATTTGTTATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336414 was detected
GTAAATTAAC is described with additional reference to Figs. 9-15.

AATTTGCTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTGGTATTA encoded by the human genome.

TATGGAAGTA GAM336414 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTTGATCCT GAM336414 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336414 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336414 precursor RNA is designated SEQ ID:5754, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5754 is located from position 15591278 to position 15591386 relative to chromosome 7 on the `-` strand.

GAM336414 precursor RNA folds onto itself, forming GAM336414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336414 precursor RNA, designated SEQ ID NO: 5754, and a schematic representation of a predicted secondary folding of GAM336414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336414 folded precursor RNA yielding a GAM336414 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336414 RNA, hereby incorporated herein.

GAM336414 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336414 target RNA, herein designated GAM TARGET RNA.

GAM336414 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336414 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336414 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336414 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336414 RNA, herein designated GAM RNA, to target binding sites on GAM336414 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336414 target RNA into GAM336414 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336414 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336414 target genes. The mRNA of each one of this plurality of GAM336414 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336414 RNA, herein designated GAM RNA, and which when bound by GAM336414 RNA causes inhibition of translation of the GAM336414 target mRNA into a corresponding GAM336414 target protein.

The mechanism of the translational inhibition exerted by GAM336414 RNA, herein designated GAM RNA, on one or more GAM336414 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336414 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336414 RNA, herein designated GAM RNA, of GAM336414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336414 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336414 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336414 RNA correlate with, and may be deduced from, the identity of the GAM336414 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336420 5842 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336420 (GAM336420) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336420 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336420 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336420 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336420 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336420 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336420 precursor RNA is designated SEQ ID:5842, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5842 is located from position 16256343 to position 16256424 relative to chromosome 10 on the `+` strand.

GAM336420 precursor RNA folds onto itself, forming GAM336420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336420 precursor RNA, designated SEQ ID NO: 5842, and a schematic representation of a predicted secondary folding of GAM336420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336420 folded precursor RNA yielding a GAM336420 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336420 RNA, hereby incorporated herein.

GAM336420 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336420 target RNA, herein designated GAM TARGET RNA.

GAM336420 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336420 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336420 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336420 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336420 RNA, herein designated GAM RNA, to target binding sites on GAM336420 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336420 target RNA into GAM336420 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336420 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336420 target genes. The mRNA of each one of this plurality of GAM336420 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336420 RNA, herein designated GAM RNA, and which when bound by GAM336420 RNA causes inhibition of translation of the GAM336420 target mRNA into a corresponding GAM336420 target protein.

The mechanism of the translational inhibition exerted by GAM336420 RNA, herein designated GAM RNA, on one or more GAM336420 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336420 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336420 RNA, herein designated GAM RNA, of GAM336420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336420 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336420 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336420 RNA correlate with, and may be deduced from, the identity of the GAM336420 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336422 6333 GAGAATTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically
TGAACCTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGTGGAGGT Messenger 336422 (GAM336422) oligonucleotides modulates expression of respective target
TGTGGTGAGC genes whose function and utility is known in the art.

CGAAATTGTG GAM336422 is a novel bioinformatically detectable regulatory, non protein
CCATTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336422 was detected
CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAAACTC encoded by the human genome.

GAM336422 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336422 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336422 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336422 precursor RNA is designated SEQ ID:6333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6333 is located from position 16344259 to position 16344345 relative to chromosome 3 on the `+` strand.

GAM336422 precursor RNA folds onto itself, forming GAM336422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336422 precursor RNA, designated SEQ ID NO: 6333, and a schematic representation of a predicted secondary folding of GAM336422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336422 folded precursor RNA yielding a GAM336422 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336422 RNA, hereby incorporated herein. Expression of GAM336422 RNA was experimentally validated in HeLa cells using the methods

described with reference to Figs.22 to 24.

GAM336422 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336422 target RNA, herein designated GAM TARGET RNA.

GAM336422 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336422 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336422 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336422 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336422 RNA, herein designated GAM RNA, to target binding sites on GAM336422 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336422 target RNA into GAM336422 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336422 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336422 target genes. The mRNA of each one of this plurality of GAM336422 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336422 RNA, herein designated GAM RNA, and which when bound by GAM336422 RNA causes inhibition of translation of the GAM336422 target mRNA into a corresponding GAM336422 target protein.

The mechanism of the translational inhibition exerted by GAM336422 RNA, herein designated GAM RNA, on one or more GAM336422 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336422 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336422 RNA, herein designated GAM RNA, of GAM336422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336422 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336422 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336422 RNA correlate with, and may be deduced from, the identity of the GAM336422 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATGTCTGGCT genes whose function and utility is known in the art.

GATTTTTGTA GAM336424 is a novel bioinformatically detectable regulatory, non protein
TTTTTAGTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336424 was detected
AGGTGGGGTT is described with additional reference to Figs. 9-15.

TCACCATGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGCCAGGCTG encoded by the human genome.

GTC GAM336424 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336424 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336424 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336424 precursor RNA is designated SEQ ID:6461, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6461 is located from position 16592675 to position 16592767 relative to chromosome 16 on the `+` strand.

GAM336424 precursor RNA folds onto itself, forming GAM336424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336424 precursor RNA, designated SEQ ID NO: 6461, and a schematic representation of a predicted secondary folding of GAM336424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336424 folded precursor RNA yielding a GAM336424 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336424 RNA, hereby incorporated herein.

GAM336424 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336424 target RNA, herein designated GAM TARGET RNA.

GAM336424 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336424 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336424 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336424 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336424 RNA, herein designated GAM RNA, to target binding sites on GAM336424 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336424 target RNA into GAM336424 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336424 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336424 target genes. The mRNA of each one of this plurality of GAM336424 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336424 RNA, herein designated GAM RNA, and which when bound by GAM336424 RNA causes inhibition of translation of the GAM336424 target mRNA into a corresponding GAM336424 target protein.

The mechanism of the translational inhibition exerted by GAM336424 RNA, herein designated GAM RNA, on one or more GAM336424 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336424 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336424 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336424 RNA, herein designated GAM RNA, of GAM336424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336424 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336424 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336424 RNA correlate with, and may be deduced from, the identity of the GAM336424 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAACATGCAG Messenger 336426 (GAM336426) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336426 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336426 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336426 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336426 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336426 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336426 precursor RNA is designated SEQ ID:5843, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5843 is located from position 16815249 to position 16815330 relative to chromosome 3 on the `-` strand.

GAM336426 precursor RNA folds onto itself, forming GAM336426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336426 precursor RNA, designated SEQ ID NO: 5843, and a schematic representation of a predicted secondary folding of GAM336426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336426 folded precursor RNA yielding a GAM336426 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336426 RNA, hereby incorporated herein.

GAM336426 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336426 target RNA, herein designated GAM TARGET RNA.

GAM336426 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336426 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336426 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336426 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336426 RNA, herein designated GAM RNA, to target binding sites on GAM336426 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336426 target RNA into GAM336426 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336426 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336426 target genes. The mRNA of each one of this plurality of GAM336426 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336426 RNA, herein designated GAM RNA, and which when bound by GAM336426 RNA causes inhibition of translation of the GAM336426 target mRNA into a corresponding GAM336426 target protein.

The mechanism of the translational inhibition exerted by GAM336426 RNA, herein

designated GAM RNA, on one or more GAM336426 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336426 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336426 RNA, herein designated GAM RNA, of GAM336426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336426 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336426 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336426 RNA correlate with, and may be deduced from, the identity of the GAM336426 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336428 6931 GTGTTCGAGC Fig. 8 further provides a conceptual description of another novel bioinformatically
ACACACCTCC detected oligonucleotides of the present invention, referred to here as Genomic Address
TTGCAGTGGC Messenger 336428 (GAM336428) oligonucleotides modulates expression of respective target
TTCAGCACCC genes whose function and utility is known in the art.

AGGTCTCCGG GAM336428 is a novel bioinformatically detectable regulatory, non protein
GAGCCAGTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336428 was detected
AGGAACCAAG is described with additional reference to Figs. 9-15.

TGTTGGATAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336428 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336428 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336428 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336428 precursor RNA is designated SEQ ID:6931, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6931 is located from position 16882174 to position 16882253

relative to chromosome 22 on the `+` strand.

GAM336428 precursor RNA folds onto itself, forming GAM336428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336428 precursor RNA, designated SEQ ID NO: 6931, and a schematic representation of a predicted secondary folding of GAM336428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336428 folded precursor RNA yielding a GAM336428 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336428 RNA, hereby incorporated herein.

GAM336428 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336428 target RNA, herein designated GAM TARGET RNA.

GAM336428 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336428 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336428 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336428 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336428 RNA, herein designated GAM RNA, to target binding sites on GAM336428 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336428 target RNA into GAM336428 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336428 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336428 target genes. The mRNA of each one of this plurality of GAM336428 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336428 RNA, herein designated GAM RNA, and which when bound by GAM336428 RNA causes inhibition of translation of the GAM336428 target mRNA into a corresponding GAM336428 target protein.

The mechanism of the translational inhibition exerted by GAM336428 RNA, herein designated GAM RNA, on one or more GAM336428 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336428 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336428 RNA, herein designated GAM RNA, of GAM336428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336428 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336428 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336428 RNA correlate with, and may be deduced from, the identity of the GAM336428 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336429 6591 GGACCTGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCATCAGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTGACCAGA Messenger 336429 (GAM336429) oligonucleotides modulates expression of respective target
TAGGAGTTTT genes whose function and utility is known in the art.

TGCCTCGTGT GAM336429 is a novel bioinformatically detectable regulatory, non protein
CTGGGTGCTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336429 was detected
CGATTTTGTG is described with additional reference to Figs. 9-15.

CCGTTCTCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGTCC encoded by the human genome.

GAM336429 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336429 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336429 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336429 precursor RNA is designated SEQ ID:6591, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6591 is located from position 17033275 to position 17033360 relative to chromosome 17 on the `+` strand.

GAM336429 precursor RNA folds onto itself, forming GAM336429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336429 precursor RNA, designated SEQ ID NO: 6591, and a schematic representation of a predicted secondary folding of GAM336429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336429 folded precursor RNA yielding a GAM336429 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336429 RNA, hereby incorporated herein.

GAM336429 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336429 target RNA, herein designated GAM TARGET RNA.

GAM336429 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336429 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336429 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336429 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336429 RNA, herein designated GAM RNA, to target

binding sites on GAM336429 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336429 target RNA into GAM336429 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336429 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336429 target genes. The mRNA of each one of this plurality of GAM336429 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336429 RNA, herein designated GAM RNA, and which when bound by GAM336429 RNA causes inhibition of translation of the GAM336429 target mRNA into a corresponding GAM336429 target protein.

The mechanism of the translational inhibition exerted by GAM336429 RNA, herein designated GAM RNA, on one or more GAM336429 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336429 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336429 RNA, herein designated GAM RNA, of GAM336429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336429 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336429 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336429 RNA correlate with, and may be deduced from, the identity of the GAM336429 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336430 6750 GGCCTCCTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGCGTCACG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAATGCTGTC Messenger 336430 (GAM336430) oligonucleotides modulates expression of respective target

CTGATCCCTA genes whose function and utility is known in the art.

GCATTTACTC GAM336430 is a novel bioinformatically detectable regulatory, non protein

ACATGCTGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336430 was detected

CTTAGTGCTT is described with additional reference to Figs. 9-15.

GACCATGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGCAGATTC encoded by the human genome.

TGTGATGTGT GAM336430 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAGACGTGGT GAM336430 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

TGCC GAM336430 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336430 precursor RNA is designated SEQ ID:6750, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6750 is located from position 17062054 to position 17062167 relative to chromosome 7 on the `+` strand.

GAM336430 precursor RNA folds onto itself, forming GAM336430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336430 precursor RNA, designated SEQ ID NO: 6750, and a schematic representation of a predicted secondary folding of GAM336430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336430 folded precursor RNA yielding a GAM336430 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336430 RNA, hereby incorporated herein.

GAM336430 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336430 target RNA, herein designated GAM TARGET RNA.

GAM336430 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336430 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336430 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336430 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336430 RNA, herein designated GAM RNA, to target binding sites on GAM336430 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336430 target RNA into GAM336430 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336430 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336430 target genes. The mRNA of each one of this plurality of GAM336430 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336430 RNA, herein designated GAM RNA, and which when bound by GAM336430 RNA causes inhibition of translation of the GAM336430 target mRNA into a corresponding GAM336430 target protein.

The mechanism of the translational inhibition exerted by GAM336430 RNA, herein designated GAM RNA, on one or more GAM336430 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336430 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336430 RNA, herein designated GAM RNA, of GAM336430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336430 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336430 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336430 RNA correlate with, and may be deduced from, the identity of the GAM336430 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCTAGCATTT genes whose function and utility is known in the art.

ACTCACATGC GAM336431 is a novel bioinformatically detectable regulatory, non protein
TGTGCTTAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336431 was detected
GCTTGACCAT is described with additional reference to Figs. 9-15.

GTGGTGGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTCTGTGAT encoded by the human genome.

GTGTAAG GAM336431 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336431 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336431 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336431 precursor RNA is designated SEQ ID:6164, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6164 is located from position 17062060 to position 17062156 relative to chromosome 7 on the `+` strand.

GAM336431 precursor RNA folds onto itself, forming GAM336431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336431 precursor RNA, designated SEQ ID NO: 6164, and a schematic representation of a predicted secondary folding of GAM336431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336431 folded precursor RNA yielding a GAM336431 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336431 RNA, hereby incorporated herein.

GAM336431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336431 target RNA, herein designated GAM TARGET RNA.

GAM336431 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336431 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336431 RNA, herein designated GAM RNA, to target binding sites on GAM336431 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336431 target RNA into GAM336431 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336431 target genes. The mRNA of each one of this plurality of GAM336431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336431 RNA, herein designated GAM RNA, and which when bound by GAM336431 RNA causes inhibition of translation of the GAM336431 target mRNA into a corresponding GAM336431 target protein.

The mechanism of the translational inhibition exerted by GAM336431 RNA, herein designated GAM RNA, on one or more GAM336431 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336431 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336431 RNA, herein designated GAM RNA, of GAM336431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336431 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336431 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336431 RNA correlate with, and may be deduced from, the identity of the GAM336431 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336432 6518 GCGTCACGGA ATGCTGTCCT GATCCCTAGC ATTTACTCAC ATGCTGTGCT TAGTGCTTGA CCATGTGGTG GCAGATTCTG TGATGT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336432 (GAM336432) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336432 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336432 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336432 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336432 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336432 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336432 precursor RNA is designated SEQ ID:6518, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6518 is located from position 17062066 to position 17062151 relative to chromosome 7 on the `+` strand.

GAM336432 precursor RNA folds onto itself, forming GAM336432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336432 precursor RNA, designated SEQ ID NO: 6518, and a schematic representation of a predicted secondary folding of GAM336432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336432 folded precursor RNA yielding a GAM336432 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336432 RNA, hereby incorporated herein.

GAM336432 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336432 target RNA, herein designated GAM TARGET RNA.

GAM336432 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336432 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336432 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336432 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336432 RNA, herein designated GAM RNA, to target binding sites on GAM336432 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336432 target RNA into GAM336432 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336432 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336432 target genes. The mRNA of each one of this plurality of GAM336432 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336432 RNA, herein designated GAM RNA, and which when bound by GAM336432 RNA causes inhibition of translation of the GAM336432 target mRNA into a corresponding GAM336432 target protein.

The mechanism of the translational inhibition exerted by GAM336432 RNA, herein designated GAM RNA, on one or more GAM336432 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336432 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336432 RNA, herein designated GAM RNA, of GAM336432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336432 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336432 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336432 RNA correlate with, and may be deduced from, the identity of the GAM336432 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336433 6148 CGTCACGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCTGTCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
ATCCCTAGCA Messenger 336433 (GAM336433) oligonucleotides modulates expression of respective target
TTTACTCACA genes whose function and utility is known in the art.

TGCTGTGCTT GAM336433 is a novel bioinformatically detectable regulatory, non protein
AGTGCTTGAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336433 was detected
CATGTGGTGG is described with additional reference to Figs. 9-15.

CAGATTCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATG encoded by the human genome.

GAM336433 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336433 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336433 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336433 precursor RNA is designated SEQ ID:6148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6148 is located from position 17062067 to position 17062150 relative to chromosome 7 on the `+` strand.

GAM336433 precursor RNA folds onto itself, forming GAM336433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336433 precursor RNA, designated SEQ ID NO: 6148, and a schematic representation of a predicted secondary folding of GAM336433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336433 folded precursor RNA yielding a GAM336433 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336433 RNA, hereby incorporated herein.

GAM336433 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336433 target RNA, herein designated GAM TARGET RNA.

GAM336433 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336433 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336433 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336433 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336433 RNA, herein designated GAM RNA, to target binding sites on GAM336433 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336433 target RNA into GAM336433 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336433 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336433 target genes. The mRNA of each one of this plurality of GAM336433 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336433 RNA, herein designated GAM RNA, and which when bound by GAM336433 RNA causes inhibition of translation of the GAM336433 target mRNA into a corresponding GAM336433 target protein.

The mechanism of the translational inhibition exerted by GAM336433 RNA, herein designated GAM RNA, on one or more GAM336433 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336433 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336433 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336433 RNA, herein designated GAM RNA, of GAM336433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336433 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336433 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336433 RNA correlate with, and may be deduced from, the identity of the GAM336433 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336434 6317 GAGAACTGTA Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGCAAGGTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TTGCCAACTT Messenger 336434 (GAM336434) oligonucleotides modulates expression of respective target
TTTGACCAGA genes whose function and utility is known in the art.

ATCCTCGGTG GAM336434 is a novel bioinformatically detectable regulatory, non protein
AGTAATAAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336434 was detected
TTTGCACTGC is described with additional reference to Figs. 9-15.

AGCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336434 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336434 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336434 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336434 precursor RNA is designated SEQ ID:6317, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6317 is located from position 17392534 to position 17392608 relative to chromosome 20 on the `+` strand.

GAM336434 precursor RNA folds onto itself, forming GAM336434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336434 precursor RNA, designated SEQ ID NO: 6317, and a schematic representation of a predicted secondary folding of GAM336434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336434 folded precursor RNA yielding a GAM336434 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336434 RNA, hereby incorporated herein.

GAM336434 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336434 target RNA, herein designated GAM TARGET RNA.

GAM336434 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336434 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336434 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336434 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336434 RNA, herein designated GAM RNA, to target binding sites on GAM336434 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336434 target RNA into GAM336434 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336434 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336434 target genes. The mRNA of each one of this plurality of GAM336434 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336434 RNA, herein designated GAM RNA, and which when bound by GAM336434 RNA causes inhibition of translation of the GAM336434 target mRNA into a corresponding GAM336434 target protein.

The mechanism of the translational inhibition exerted by GAM336434 RNA, herein

designated GAM RNA, on one or more GAM336434 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336434 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336434 RNA, herein designated GAM RNA, of GAM336434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336434 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336434 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336434 RNA correlate with, and may be deduced from, the identity of the GAM336434 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336435 6969 TAGCTGCACA Fig. 8 further provides a conceptual description of another novel bioinformatically
ACACAAGCCC detected oligonucleotides of the present invention, referred to here as Genomic Address
ACAGGCAAAC Messenger 336435 (GAM336435) oligonucleotides modulates expression of respective target
ACACAGACTC genes whose function and utility is known in the art.

CTGCAGTGTC GAM336435 is a novel bioinformatically detectable regulatory, non protein
TAGAGCAGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336435 was detected
ACTGGGATAT is described with additional reference to Figs. 9-15.

GAAGACTGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGTGGAGGCT encoded by the human genome.

GGGCAGCTA GAM336435 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336435 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336435 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336435 precursor RNA is designated SEQ ID:6969, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6969 is located from position 17533127 to position 17533225 relative to chromosome 10 on the `-` strand.

GAM336435 precursor RNA folds onto itself, forming GAM336435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336435 precursor RNA, designated SEQ ID NO: 6969, and a schematic representation of a predicted secondary folding of GAM336435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336435 folded precursor RNA yielding a GAM336435 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336435 RNA, hereby incorporated herein.

GAM336435 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336435 target RNA, herein designated GAM TARGET RNA.

GAM336435 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336435 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336435 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336435 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336435 RNA, herein designated GAM RNA, to target binding sites on GAM336435 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336435 target RNA into GAM336435 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336435 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336435 target genes. The mRNA of each one of this plurality of GAM336435 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336435 RNA, herein designated GAM RNA, and which when bound by GAM336435 RNA causes inhibition of translation of the GAM336435 target mRNA into a corresponding GAM336435 target protein.

The mechanism of the translational inhibition exerted by GAM336435 RNA, herein designated GAM RNA, on one or more GAM336435 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336435 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336435 RNA, herein designated GAM RNA, of GAM336435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336435 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336435 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336435 RNA correlate with, and may be deduced from, the identity of the GAM336435 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336439 7335 TTGGGGGTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTACATGCAT detected oligonucleotides of the present invention, referred to here as Genomic Address

GATGCTGAGG Messenger 336439 (GAM336439) oligonucleotides modulates expression of respective target

TTTGGGAATA genes whose function and utility is known in the art.

TGGATGGTCC GAM336439 is a novel bioinformatically detectable regulatory, non protein

CATCACCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336439 was detected

GTGATGTATG is described with additional reference to Figs. 9-15.

TAGTACCCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336439 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336439 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336439 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336439 precursor RNA is designated SEQ ID:7335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7335 is located from position 18148992 to position 18149071 relative to chromosome 11 on the `+` strand.

GAM336439 precursor RNA folds onto itself, forming GAM336439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336439 precursor RNA, designated SEQ ID NO: 7335, and a schematic representation of a predicted secondary folding of GAM336439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336439 folded precursor RNA yielding a GAM336439 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336439 RNA, hereby incorporated herein.

GAM336439 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336439 target RNA, herein designated GAM TARGET RNA.

GAM336439 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336439 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336439 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336439 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336439 RNA, herein designated GAM RNA, to target binding sites on GAM336439 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336439 target RNA into GAM336439 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336439 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336439 target genes. The mRNA of each one of this plurality of GAM336439 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336439 RNA, herein designated GAM RNA, and which when bound by GAM336439 RNA causes inhibition of translation of the GAM336439 target mRNA into a corresponding GAM336439 target protein.

The mechanism of the translational inhibition exerted by GAM336439 RNA, herein designated GAM RNA, on one or more GAM336439 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336439 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336439 RNA, herein designated GAM RNA, of GAM336439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336439 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336439 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336439 RNA correlate with, and may be deduced from, the identity of the GAM336439 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336440 6828 GGGTTGTTAC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGCATGATG detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGAGGTTTG Messenger 336440 (GAM336440) oligonucleotides modulates expression of respective target

GGAATATGGA genes whose function and utility is known in the art.

TGGTCCCATC GAM336440 is a novel bioinformatically detectable regulatory, non protein

ACCCAGGTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336440 was detected

TGTATGTAGT is described with additional reference to Figs. 9-15.

ACCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336440 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336440 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336440 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336440 precursor RNA is designated SEQ ID:6828, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6828 is located from position 18148996 to position 18149069 relative to chromosome 11 on the `+` strand.

GAM336440 precursor RNA folds onto itself, forming GAM336440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336440 precursor RNA, designated SEQ ID NO: 6828, and a schematic representation of a predicted secondary folding of GAM336440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336440 folded precursor RNA yielding a GAM336440 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336440 RNA, hereby incorporated herein.

GAM336440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336440 target RNA, herein designated GAM TARGET RNA.

GAM336440 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336440 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336440 RNA, herein designated GAM RNA, to target binding sites on GAM336440 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336440 target RNA into GAM336440 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336440 target genes. The mRNA of each one of this plurality of GAM336440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336440 RNA, herein designated GAM RNA, and which when bound by GAM336440 RNA causes inhibition of translation of the GAM336440 target mRNA into a corresponding GAM336440 target protein.

The mechanism of the translational inhibition exerted by GAM336440 RNA, herein designated GAM RNA, on one or more GAM336440 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336440 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336440 RNA, herein designated GAM RNA, of GAM336440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336440 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336440 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336440 RNA correlate with, and may be deduced from, the identity of the GAM336440 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336441 6730 GGCAGGAAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCCTTCACC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGGAGGTGG Messenger 336441 (GAM336441) oligonucleotides modulates expression of respective target
AGGTTGCAGT genes whose function and utility is known in the art.

GAGCCAAGAT GAM336441 is a novel bioinformatically detectable regulatory, non protein
TGCACCACTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336441 was detected
CACTCCTAGG is described with additional reference to Figs. 9-15.

CAATGGAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGACCTTGTC encoded by the human genome.

GAM336441 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336441 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336441 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336441 precursor RNA is designated SEQ ID:6730, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6730 is located from position 18229150 to position 18229239 relative to chromosome Y on the `+` strand.

GAM336441 precursor RNA folds onto itself, forming GAM336441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336441 precursor RNA, designated SEQ ID NO: 6730, and a schematic representation of a predicted secondary folding of GAM336441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336441 folded precursor RNA yielding a GAM336441 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336441 RNA, hereby incorporated herein.

GAM336441 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336441 target RNA, herein designated GAM TARGET RNA.

GAM336441 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336441 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336441 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336441 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336441 RNA, herein designated GAM RNA, to target binding sites on GAM336441 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336441 target RNA into GAM336441 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336441 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336441 target genes. The mRNA of each one of this plurality of GAM336441 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336441 RNA, herein designated GAM RNA, and which when bound by GAM336441 RNA causes inhibition of translation of the GAM336441 target mRNA into a corresponding GAM336441 target protein.

The mechanism of the translational inhibition exerted by GAM336441 RNA, herein designated GAM RNA, on one or more GAM336441 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336441 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336441 RNA, herein designated GAM RNA, of GAM336441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336441 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336441 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336441

RNA correlate with, and may be deduced from, the identity of the GAM336441 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336442 6540 GCTCTTTAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGTAAGCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACTGTTTTG Messenger 336442 (GAM336442) oligonucleotides modulates expression of respective target
TTTTCTGTGC genes whose function and utility is known in the art.

TGCTTAGTGC GAM336442 is a novel bioinformatically detectable regulatory, non protein
AGGACAATAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336442 was detected
AGAGCAGATC is described with additional reference to Figs. 9-15.

TGGCTCTGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTTAGCAGC encoded by the human genome.

GAM336442 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336442 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336442 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336442 precursor RNA is designated SEQ ID:6540, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6540 is located from position 18307900 to position 18307989 relative to chromosome 9 on the `+` strand.

GAM336442 precursor RNA folds onto itself, forming GAM336442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336442 precursor RNA, designated SEQ ID NO: 6540, and a schematic representation of a predicted secondary folding of GAM336442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336442 folded precursor RNA yielding a GAM336442 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336442 RNA, hereby incorporated herein.

GAM336442 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336442 target RNA, herein designated GAM TARGET RNA.

GAM336442 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336442 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336442 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336442 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336442 RNA, herein designated GAM RNA, to target binding sites on GAM336442 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336442 target RNA into GAM336442 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336442 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336442 target genes. The mRNA of each one of this plurality of GAM336442 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336442 RNA, herein designated GAM RNA, and which when bound by GAM336442 RNA causes inhibition of translation of the GAM336442 target mRNA into a corresponding GAM336442 target protein.

The mechanism of the translational inhibition exerted by GAM336442 RNA, herein designated GAM RNA, on one or more GAM336442 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336442 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336442 RNA, herein designated GAM RNA, of GAM336442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336442 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336442 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336442 RNA correlate with, and may be deduced from, the identity of the GAM336442 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336445 6158 CTCAGAGGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGCCATGAG Messenger 336445 (GAM336445) oligonucleotides modulates expression of respective target
GCTGGACTGC genes whose function and utility is known in the art.

AGCTGTGGTG GAM336445 is a novel bioinformatically detectable regulatory, non protein
GCAAGTGACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336445 was detected
AGATGTCACT is described with additional reference to Figs. 9-15.

GAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336445 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336445 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336445 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336445 precursor RNA is designated SEQ ID:6158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6158 is located from position 18488728 to position 18488800 relative to chromosome 22 on the `+` strand.

GAM336445 precursor RNA folds onto itself, forming GAM336445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336445 precursor RNA, designated SEQ ID NO: 6158, and a schematic representation of a predicted secondary folding of GAM336445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336445 folded precursor RNA yielding a GAM336445 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336445 RNA, hereby incorporated herein.

GAM336445 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336445 target RNA, herein designated GAM TARGET RNA.

GAM336445 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336445 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336445 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336445 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336445 RNA, herein designated GAM RNA, to target binding sites on GAM336445 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336445 target RNA into GAM336445 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336445 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336445 target genes. The mRNA of each one of this plurality of GAM336445 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336445 RNA, herein designated GAM RNA, and which when bound by GAM336445 RNA causes inhibition of translation of the GAM336445 target mRNA into a corresponding GAM336445 target protein.

The mechanism of the translational inhibition exerted by GAM336445 RNA, herein designated GAM RNA, on one or more GAM336445 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336445 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336445 RNA, herein designated GAM RNA, of GAM336445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336445 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336445 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336445 RNA correlate with, and may be deduced from, the identity of the GAM336445 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTTAATATTT detected oligonucleotides of the present invention, referred to here as Genomic Address
AAAAAACTGT Messenger 336447 (GAM336447) oligonucleotides modulates expression of respective target
ATTGTGCATT genes whose function and utility is known in the art.

TTGGCTTCAC GAM336447 is a novel bioinformatically detectable regulatory, non protein
ATGTTTAACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336447 was detected
TTTTTTAAGA is described with additional reference to Figs. 9-15.

AAAAAGTTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATGAATGGAA encoded by the human genome.

AAAAAATCTG GAM336447 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TATACAGTAT GAM336447 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CTGTAAAAAC GAM336447 precursor RNA does not encode a protein. A nucleotide sequence identical or

TGTCTTATCT highly similar to the nucleotide sequence of GAM336447 precursor RNA is designated SEQ

ID:5712, and is provided hereinbelow with reference to the sequence listing part.
Nucleotide sequence SEQ ID:5712 is located from position 18512666 to position 18512795 relative to chromosome 17 on the `-` strand.

GAM336447 precursor RNA folds onto itself, forming GAM336447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336447 precursor RNA, designated SEQ ID NO: 5712, and a schematic representation of a predicted secondary folding of GAM336447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336447 folded precursor RNA yielding a GAM336447 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336447 RNA, hereby incorporated herein.

GAM336447 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336447 target RNA, herein designated GAM TARGET RNA.

GAM336447 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336447 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336447 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336447 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336447 RNA, herein designated GAM RNA, to target binding sites on GAM336447 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336447 target RNA into GAM336447 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336447 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336447 target genes. The mRNA of each one of this plurality of GAM336447 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336447 RNA, herein designated GAM RNA, and which when bound by GAM336447 RNA causes inhibition of translation of the GAM336447 target mRNA into a corresponding GAM336447 target protein.

The mechanism of the translational inhibition exerted by GAM336447 RNA, herein designated GAM RNA, on one or more GAM336447 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336447 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336447 RNA, herein designated GAM RNA, of GAM336447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336447 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336447 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336447 RNA correlate with, and may be deduced from, the identity of the GAM336447 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336448 6462 GAGTAGCTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GATTACAGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGTGCCACC Messenger 336448 (GAM336448) oligonucleotides modulates expression of respective target

ATGTCTGGCT genes whose function and utility is known in the art.

GATTTTTGTA GAM336448 is a novel bioinformatically detectable regulatory, non protein

TTTTTAGTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336448 was detected

AGGTGGGGTT is described with additional reference to Figs. 9-15.

TCACCATGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGCCAGGCTG encoded by the human genome.

GTC GAM336448 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336448 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336448 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336448 precursor RNA is designated SEQ

ID:6462, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6462 is located from position 18720857 to position 18720949 relative to chromosome 16 on the `-` strand.

GAM336448 precursor RNA folds onto itself, forming GAM336448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336448 precursor RNA, designated SEQ ID NO: 6462, and a schematic representation of a predicted secondary folding of GAM336448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336448 folded precursor RNA yielding a GAM336448 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336448 RNA, hereby incorporated herein.

GAM336448 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336448 target RNA, herein designated GAM TARGET RNA.

GAM336448 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336448 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336448 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336448 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336448 RNA, herein designated GAM RNA, to target binding sites on GAM336448 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336448 target RNA into GAM336448 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336448 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336448 target genes. The mRNA of each one of this plurality of GAM336448 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336448 RNA, herein designated GAM RNA, and which when bound by GAM336448 RNA causes inhibition of translation of the GAM336448 target mRNA into a corresponding GAM336448 target protein.

The mechanism of the translational inhibition exerted by GAM336448 RNA, herein designated GAM RNA, on one or more GAM336448 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336448 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336448 RNA, herein designated GAM RNA, of GAM336448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336448 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336448 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336448 RNA correlate with, and may be deduced from, the identity of the GAM336448 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336450 6177 CTCTGTAGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGTGCGGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTACACTATT Messenger 336450 (GAM336450) oligonucleotides modulates expression of respective target

TTACATGGTC genes whose function and utility is known in the art.

ACTATCAGCT GAM336450 is a novel bioinformatically detectable regulatory, non protein

TAGTTGTTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336450 was detected

TCACTTGTTG is described with additional reference to Figs. 9-15.

GTGACTGCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAAGGTAGAT encoded by the human genome.

TTGAGATGTC GAM336450 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CAGGGACTGC GAM336450 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

AGAG GAM336450 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336450 precursor RNA is designated SEQ ID:6177, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6177 is located from position 18853144 to position 18853257 relative to chromosome 10 on the `+` strand.

GAM336450 precursor RNA folds onto itself, forming GAM336450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336450 precursor RNA, designated SEQ ID NO: 6177, and a schematic representation of a predicted secondary folding of GAM336450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336450 folded precursor RNA yielding a GAM336450 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336450 RNA, hereby incorporated herein.

GAM336450 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336450 target RNA, herein designated GAM TARGET RNA.

GAM336450 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336450 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336450 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336450 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336450 RNA, herein designated GAM RNA, to target binding sites on GAM336450 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336450 target RNA into GAM336450 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336450 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336450 target genes. The mRNA of each one of this plurality of GAM336450 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336450 RNA, herein designated GAM RNA, and which when bound by GAM336450 RNA causes inhibition of translation of the GAM336450 target mRNA into a corresponding GAM336450 target protein.

The mechanism of the translational inhibition exerted by GAM336450 RNA, herein designated GAM RNA, on one or more GAM336450 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336450 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336450 RNA, herein designated GAM RNA, of GAM336450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336450 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336450 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336450 RNA correlate with, and may be deduced from, the identity of the GAM336450 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336451 6506 GCCCTAAACG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGGGGGCCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CAAGTTACGA Messenger 336451 (GAM336451) oligonucleotides modulates expression of respective target

CTTCTCAAGG genes whose function and utility is known in the art.

CAGTGACATC GAM336451 is a novel bioinformatically detectable regulatory, non protein
TTCCTCAATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336451 was detected
GGTATGAGTA is described with additional reference to Figs. 9-15.

GCTGCCAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAAGTACG encoded by the human genome.

TATAAGAGTG GAM336451 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TCCCATATTC GAM336451 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TGGC GAM336451 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336451 precursor RNA is designated SEQ ID:6506, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6506 is located from position 18960647 to position 18960760 relative to chromosome 18 on the `+` strand.

GAM336451 precursor RNA folds onto itself, forming GAM336451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336451 precursor RNA, designated SEQ ID NO: 6506, and a schematic representation of a predicted secondary folding of GAM336451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336451 folded precursor RNA yielding a GAM336451 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336451 RNA, hereby incorporated herein.

GAM336451 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336451 target RNA, herein designated GAM TARGET RNA.

GAM336451 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336451 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336451 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336451 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336451 RNA, herein designated GAM RNA, to target binding sites on GAM336451 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336451 target RNA into GAM336451 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336451 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336451 target genes. The mRNA of each one of this plurality of GAM336451 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336451 RNA, herein designated GAM RNA, and which when bound by GAM336451 RNA causes inhibition of translation of the GAM336451 target mRNA into a corresponding GAM336451 target protein.

The mechanism of the translational inhibition exerted by GAM336451 RNA, herein designated GAM RNA, on one or more GAM336451 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336451 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336451 RNA, herein designated GAM RNA, of GAM336451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336451 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336451 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336451 RNA correlate with, and may be deduced from, the identity of the GAM336451 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336452 6812 GGGGCCTCAA Fig. 8 further provides a conceptual description of another novel bioinformatically
GTTACGACTT detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCAAGGCAG Messenger 336452 (GAM336452) oligonucleotides modulates expression of respective target
TGACATCTTC genes whose function and utility is known in the art.

CTCAATTGGT GAM336452 is a novel bioinformatically detectable regulatory, non protein
ATGAGTAGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336452 was detected
GCCAGGCAAC is described with additional reference to Figs. 9-15.

AAGTACGTAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGAGTGTCC encoded by the human genome.

C GAM336452 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336452 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336452 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336452 precursor RNA is designated SEQ ID:6812, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6812 is located from position 18960660 to position 18960750 relative to chromosome 18 on the `+` strand.

GAM336452 precursor RNA folds onto itself, forming GAM336452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336452 precursor RNA, designated SEQ ID NO: 6812, and a schematic representation of a predicted secondary folding of GAM336452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336452 folded precursor RNA yielding a GAM336452 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336452 RNA, hereby incorporated herein.

GAM336452 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336452 target RNA, herein designated GAM TARGET RNA.

GAM336452 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336452 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336452 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336452 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336452 RNA, herein designated GAM RNA, to target binding sites on GAM336452 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336452 target RNA into GAM336452 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336452 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336452 target genes. The mRNA of each one of this plurality of GAM336452 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336452 RNA, herein designated GAM RNA, and which when bound by GAM336452 RNA causes inhibition of translation of the GAM336452 target mRNA into a corresponding GAM336452 target protein.

The mechanism of the translational inhibition exerted by GAM336452 RNA, herein designated GAM RNA, on one or more GAM336452 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336452 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336452 RNA, herein designated GAM RNA, of GAM336452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336452 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336452 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336452 RNA correlate with, and may be deduced from, the identity of the GAM336452 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336453 7195 TGCACCTTCC Fig. 8 further provides a conceptual description of another novel bioinformatically
CTGGGACAAC detected oligonucleotides of the present invention, referred to here as Genomic Address
TTTCTTATTG Messenger 336453 (GAM336453) oligonucleotides modulates expression of respective target
ATGGGTCTTG genes whose function and utility is known in the art.

TGTTTAATTA GAM336453 is a novel bioinformatically detectable regulatory, non protein
ATGAGAGTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336453 was detected
GTTTTAGGGG is described with additional reference to Figs. 9-15.

TATGGGCCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGTGCA encoded by the human genome.

GAM336453 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336453 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336453 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336453 precursor RNA is designated SEQ ID:7195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7195 is located from position 19104724 to position 19104809 relative to chromosome 15 on the `-` strand.

GAM336453 precursor RNA folds onto itself, forming GAM336453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336453 precursor RNA, designated SEQ ID NO: 7195, and a schematic representation of a predicted secondary folding of GAM336453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336453 folded precursor RNA yielding a GAM336453 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336453 RNA, hereby incorporated herein.

GAM336453 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336453 target RNA, herein designated GAM TARGET RNA.

GAM336453 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336453 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336453 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336453 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336453 RNA, herein designated GAM RNA, to target binding sites on GAM336453 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336453 target RNA into GAM336453 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336453 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336453 target genes. The mRNA of each one of this plurality of GAM336453 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336453 RNA, herein designated GAM RNA, and which when bound by GAM336453 RNA causes inhibition of translation of the GAM336453 target mRNA into a corresponding GAM336453 target protein.

The mechanism of the translational inhibition exerted by GAM336453 RNA, herein designated GAM RNA, on one or more GAM336453 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336453 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336453 RNA, herein designated GAM RNA, of GAM336453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336453 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336453 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336453 RNA correlate with, and may be deduced from, the identity of the GAM336453 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336454 7125 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAAGGCGTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCAGGAGG Messenger 336454 (GAM336454) oligonucleotides modulates expression of respective target
CGGAGCTTGC genes whose function and utility is known in the art.

AGTGAGCAGA GAM336454 is a novel bioinformatically detectable regulatory, non protein
GATCGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336454 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGCGAGA encoded by the human genome.

CTCCGTCTCA GAM336454 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336454 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336454 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336454 precursor RNA is designated SEQ ID:7125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7125 is located from position 19125660 to position 19125759 relative to chromosome 1 on the `+` strand.

GAM336454 precursor RNA folds onto itself, forming GAM336454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336454 precursor RNA, designated SEQ ID NO: 7125, and a schematic representation of a predicted secondary folding of GAM336454 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336454 folded precursor RNA yielding a GAM336454 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336454 RNA, hereby incorporated herein. Expression of GAM336454 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336454 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336454 target RNA, herein designated GAM TARGET RNA.

GAM336454 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336454 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336454 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336454 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336454 RNA, herein designated GAM RNA, to target binding sites on GAM336454 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336454 target RNA into GAM336454 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336454 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336454 target genes. The mRNA of each one of this plurality of GAM336454 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336454 RNA, herein designated GAM RNA, and which when bound by GAM336454 RNA causes inhibition of translation of the GAM336454 target mRNA into a corresponding GAM336454 target protein.

The mechanism of the translational inhibition exerted by GAM336454 RNA, herein designated GAM RNA, on one or more GAM336454 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336454 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336454 RNA, herein designated GAM RNA, of GAM336454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336454 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336454 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336454 RNA correlate with, and may be deduced from, the identity of the GAM336454 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336455 (GAM336455) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336455 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336455 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336455 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336455 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336455 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336455 precursor RNA is designated SEQ ID:6476, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6476 is located from position 19182411 to position 19182470 relative to chromosome 17 on the `+` strand.

GAM336455 precursor RNA folds onto itself, forming GAM336455 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336455 precursor RNA, designated SEQ ID NO: 6476, and a schematic representation of a predicted secondary folding of GAM336455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336455 folded precursor RNA yielding a GAM336455 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336455 RNA, hereby incorporated herein.

GAM336455 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336455 target RNA, herein designated GAM TARGET RNA.

GAM336455 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336455 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336455 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336455 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336455 RNA, herein designated GAM RNA, to target binding sites on GAM336455 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336455 target RNA into GAM336455 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336455 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336455 target genes. The mRNA of each one of this plurality of GAM336455 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336455 RNA,

herein designated GAM RNA, and which when bound by GAM336455 RNA causes inhibition of translation of the GAM336455 target mRNA into a corresponding GAM336455 target protein.

The mechanism of the translational inhibition exerted by GAM336455 RNA, herein designated GAM RNA, on one or more GAM336455 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336455 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336455 RNA, herein designated GAM RNA, of GAM336455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336455 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336455 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336455 RNA correlate with, and may be deduced from, the identity of the GAM336455 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336456 6514 GCCTTGGCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCAAAGTGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGGAATACA Messenger 336456 (GAM336456) oligonucleotides modulates expression of respective target

GGTGTGAGCC genes whose function and utility is known in the art.

AACATGCCTG GAM336456 is a novel bioinformatically detectable regulatory, non protein

TCCTGTAAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336456 was detected

ATTTTTTAAA is described with additional reference to Figs. 9-15.

ACAAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336456 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336456 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336456 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336456 precursor RNA is designated SEQ ID:6514, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6514 is located from position 19183141 to position 19183217 relative to chromosome 13 on the `+` strand.

GAM336456 precursor RNA folds onto itself, forming GAM336456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336456 precursor RNA, designated SEQ ID NO: 6514, and a schematic representation of a predicted secondary folding of GAM336456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336456 folded precursor RNA yielding a GAM336456 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336456 RNA, hereby incorporated herein.

GAM336456 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336456 target RNA, herein designated GAM TARGET RNA.

GAM336456 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336456 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336456 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336456 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336456 RNA, herein designated GAM RNA, to target binding sites on GAM336456 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336456 target RNA

into GAM336456 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336456 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336456 target genes. The mRNA of each one of this plurality of GAM336456 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336456 RNA, herein designated GAM RNA, and which when bound by GAM336456 RNA causes inhibition of translation of the GAM336456 target mRNA into a corresponding GAM336456 target protein.

The mechanism of the translational inhibition exerted by GAM336456 RNA, herein designated GAM RNA, on one or more GAM336456 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336456 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336456 RNA, herein designated GAM RNA, of GAM336456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336456 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336456 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336456 RNA correlate with, and may be deduced from, the identity of the GAM336456 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336458 6610 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGTTAGAGG Messenger 336458 (GAM336458) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCCAAAATCA GAM336458 is a novel bioinformatically detectable regulatory, non protein

CACCACTGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336458 was detected

CTCCAGCCTG is described with additional reference to Figs. 9-15.

CCTGGGTAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGTGAGAT encoded by the human genome.

TCC GAM336458 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336458 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336458 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336458 precursor RNA is designated SEQ ID:6610, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6610 is located from position 19294864 to position 19294956 relative to chromosome 12 on the `+` strand.

GAM336458 precursor RNA folds onto itself, forming GAM336458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336458 precursor RNA, designated SEQ ID NO: 6610, and a schematic representation of a predicted secondary folding of GAM336458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336458 folded precursor RNA yielding a GAM336458 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336458 RNA, hereby incorporated herein.

GAM336458 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336458 target RNA, herein designated GAM TARGET RNA.

GAM336458 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336458 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336458 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336458 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336458 RNA, herein designated GAM RNA, to target binding sites on GAM336458 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336458 target RNA into GAM336458 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336458 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336458 target genes. The mRNA of each one of this plurality of GAM336458 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336458 RNA, herein designated GAM RNA, and which when bound by GAM336458 RNA causes inhibition of translation of the GAM336458 target mRNA into a corresponding GAM336458 target protein.

The mechanism of the translational inhibition exerted by GAM336458 RNA, herein designated GAM RNA, on one or more GAM336458 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336458 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336458 RNA, herein designated GAM RNA, of GAM336458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336458 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336458 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336458 RNA correlate with, and may be deduced from, the identity of the GAM336458 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTCAGCCTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTGGGGC encoded by the human genome.

GAM336461 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336461 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336461 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336461 precursor RNA is designated SEQ ID:6513, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6513 is located from position 19661582 to position 19661668 relative to chromosome 18 on the `+` strand.

GAM336461 precursor RNA folds onto itself, forming GAM336461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336461 precursor RNA, designated SEQ ID NO: 6513, and a schematic representation of a predicted secondary folding of GAM336461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336461 folded precursor RNA yielding a GAM336461 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336461 RNA, hereby incorporated herein.

GAM336461 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336461 target RNA, herein designated GAM TARGET RNA.

GAM336461 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336461 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336461 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336461 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336461 RNA, herein designated GAM RNA, to target binding sites on GAM336461 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336461 target RNA into GAM336461 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336461 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336461 target genes. The mRNA of each one of this plurality of GAM336461 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336461 RNA, herein designated GAM RNA, and which when bound by GAM336461 RNA causes inhibition of translation of the GAM336461 target mRNA into a corresponding GAM336461 target protein.

The mechanism of the translational inhibition exerted by GAM336461 RNA, herein designated GAM RNA, on one or more GAM336461 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336461 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336461 RNA, herein designated GAM RNA, of GAM336461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336461 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336461 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336461 RNA correlate with, and may be deduced from, the identity of the GAM336461 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336462 6854 GGTGTCTGCC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGTTGATCT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGAATGATGG Messenger 336462 (GAM336462) oligonucleotides modulates expression of respective target
CAAGTGGGCA genes whose function and utility is known in the art.

CTTTTCAGGT GAM336462 is a novel bioinformatically detectable regulatory, non protein
AACTATTGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336462 was detected
GATTAACTGA is described with additional reference to Figs. 9-15.

CAAAGATCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAAGGCTAC encoded by the human genome.

ACTTTGTCAC GAM336462 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTCAGAGTGC GAM336462 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CAGAGATACC GAM336462 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336462 precursor RNA is designated SEQ ID:6854, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6854 is located from position 19699736 to position 19699855 relative to chromosome 13 on the `+` strand.

GAM336462 precursor RNA folds onto itself, forming GAM336462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336462 precursor RNA, designated SEQ ID NO: 6854, and a schematic representation of a predicted secondary folding of GAM336462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336462 folded precursor RNA yielding a GAM336462 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336462 RNA, hereby incorporated herein.

GAM336462 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336462 target RNA, herein designated GAM TARGET RNA.

GAM336462 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336462 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336462 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336462 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336462 RNA, herein designated GAM RNA, to target binding sites on GAM336462 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336462 target RNA into GAM336462 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336462 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336462 target genes. The mRNA of each one of this plurality of GAM336462 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336462 RNA, herein designated GAM RNA, and which when bound by GAM336462 RNA causes inhibition of translation of the GAM336462 target mRNA into a corresponding GAM336462 target protein.

The mechanism of the translational inhibition exerted by GAM336462 RNA, herein designated GAM RNA, on one or more GAM336462 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336462 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336462 RNA, herein designated GAM RNA, of GAM336462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336462 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336462 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336462 RNA correlate with, and may be deduced from, the identity of the GAM336462 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336465 6605 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGACGGAGG Messenger 336465 (GAM336465) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCCAGATCGC GAM336465 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336465 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGACTCC encoded by the human genome.

GAM336465 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336465 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336465 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336465 precursor RNA is designated SEQ ID:6605, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6605 is located from position 19884809 to position 19884896 relative to chromosome 20 on the `+` strand.

GAM336465 precursor RNA folds onto itself, forming GAM336465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336465 precursor RNA, designated SEQ ID NO: 6605, and a schematic representation of a predicted secondary folding of GAM336465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336465 folded precursor RNA yielding a GAM336465 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336465 RNA, hereby incorporated herein. Expression of GAM336465 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336465 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336465 target RNA, herein designated GAM TARGET RNA.

GAM336465 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336465 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336465 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336465 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336465 RNA, herein designated GAM RNA, to target binding sites on GAM336465 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336465 target RNA into GAM336465 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336465 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336465 target genes. The mRNA of each one of this plurality of GAM336465 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336465 RNA, herein designated GAM RNA, and which when bound by GAM336465 RNA causes inhibition of translation of the GAM336465 target mRNA into a corresponding GAM336465 target protein.

The mechanism of the translational inhibition exerted by GAM336465 RNA, herein designated GAM RNA, on one or more GAM336465 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336465 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336465 RNA, herein designated GAM RNA, of GAM336465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336465 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336465 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336465 RNA correlate with, and may be deduced from, the identity of the GAM336465 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336468 6965 TAGAAATGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGATGAGAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TCCTCTGGGT Messenger 336468 (GAM336468) oligonucleotides modulates expression of respective target

AAGTGGGGAA genes whose function and utility is known in the art.

CTGTTTGGTC GAM336468 is a novel bioinformatically detectable regulatory, non protein

TCATCGCCTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336468 was detected

CATTTCTACA is described with additional reference to Figs. 9-15.

TCTCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336468 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336468 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336468 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336468 precursor RNA is designated SEQ ID:6965, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6965 is located from position 19896011 to position 19896086 relative to chromosome 8 on the `+` strand.

GAM336468 precursor RNA folds onto itself, forming GAM336468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336468 precursor RNA, designated SEQ ID NO: 6965, and a schematic representation of a predicted secondary folding of GAM336468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336468 folded precursor RNA yielding a GAM336468 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336468 RNA, hereby incorporated herein.

GAM336468 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336468 target RNA, herein designated GAM TARGET RNA.

GAM336468 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336468 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336468 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336468 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336468 RNA, herein designated GAM RNA, to target binding sites on GAM336468 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336468 target RNA into GAM336468 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336468 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336468 target genes. The mRNA of each one of this plurality of GAM336468 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336468 RNA, herein designated GAM RNA, and which when bound by GAM336468 RNA causes inhibition of translation of the GAM336468 target mRNA into a corresponding GAM336468 target protein.

The mechanism of the translational inhibition exerted by GAM336468 RNA, herein designated GAM RNA, on one or more GAM336468 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336468 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336468 RNA, herein designated GAM RNA, of GAM336468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336468 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336468 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336468 RNA correlate with, and may be deduced from, the identity of the GAM336468 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336469 5792 AGGTCTCATT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGTTGCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCTGGGGTA Messenger 336469 (GAM336469) oligonucleotides modulates expression of respective target

CAGTGGTGCA genes whose function and utility is known in the art.

AGTATGGCTC GAM336469 is a novel bioinformatically detectable regulatory, non protein

ACTGCAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336469 was detected

TGAACTCTTT is described with additional reference to Figs. 9-15.

CTGGGCTCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGATCCT encoded by the human genome.

GAM336469 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336469 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336469 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336469 precursor RNA is designated SEQ ID:5792, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5792 is located from position 20036295 to position 20036382 relative to chromosome 20 on the `+` strand.

GAM336469 precursor RNA folds onto itself, forming GAM336469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336469 precursor RNA, designated SEQ ID NO: 5792, and a schematic representation of a predicted secondary folding of GAM336469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336469 folded precursor RNA yielding a GAM336469 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336469 RNA, hereby incorporated herein.

GAM336469 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336469 target RNA, herein designated GAM TARGET RNA.

GAM336469 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336469 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336469 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336469 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336469 RNA, herein designated GAM RNA, to target binding sites on GAM336469 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336469 target RNA into GAM336469 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336469 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336469 target genes. The mRNA of each one of this plurality of GAM336469 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336469 RNA, herein designated GAM RNA, and which when bound by GAM336469 RNA causes inhibition of translation of the GAM336469 target mRNA into a corresponding GAM336469 target protein.

The mechanism of the translational inhibition exerted by GAM336469 RNA, herein designated GAM RNA, on one or more GAM336469 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336469 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336469 RNA, herein designated GAM RNA, of GAM336469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336469 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336469 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336469 RNA correlate with, and may be deduced from, the identity of the GAM336469 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336470 5793 AGGTCTCATT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGTTGCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCTGGGGTA Messenger 336470 (GAM336470) oligonucleotides modulates expression of respective target

CAGTGGTGCA genes whose function and utility is known in the art.

AGTATGGCTC GAM336470 is a novel bioinformatically detectable regulatory, non protein

ACTGCAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336470 was detected

TGAACTCTTT is described with additional reference to Figs. 9-15.

CTGGGCTCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGATCCTCC encoded by the human genome.

T GAM336470 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336470 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336470 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336470 precursor RNA is designated SEQ ID:5793, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5793 is located from position 20036295 to position 20036385 relative to chromosome 20 on the `+` strand.

GAM336470 precursor RNA folds onto itself, forming GAM336470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336470 precursor RNA, designated SEQ ID NO: 5793, and a schematic representation of a predicted secondary folding of GAM336470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336470 folded precursor RNA yielding a GAM336470 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336470 RNA, hereby incorporated herein.

GAM336470 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336470 target RNA, herein designated GAM TARGET RNA.

GAM336470 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336470 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336470 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336470 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336470 RNA, herein designated GAM RNA, to target binding sites on GAM336470 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336470 target RNA into GAM336470 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336470 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336470 target genes. The mRNA of each one of this plurality of GAM336470 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336470 RNA, herein designated GAM RNA, and which when bound by GAM336470 RNA causes inhibition of translation of the GAM336470 target mRNA into a corresponding GAM336470 target protein.

The mechanism of the translational inhibition exerted by GAM336470 RNA, herein designated GAM RNA, on one or more GAM336470 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336470 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336470 RNA, herein designated GAM RNA, of GAM336470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336470 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336470 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336470 RNA correlate with, and may be deduced from, the identity of the GAM336470 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336472 6014 CAGATGCCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTCGGGAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
CACAGGATCC Messenger 336472 (GAM336472) oligonucleotides modulates expression of respective target
AGAGAGTCAA genes whose function and utility is known in the art.

TGAAAGTAAA GAM336472 is a novel bioinformatically detectable regulatory, non protein
ACTTCAGGAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336472 was detected
TGTCTGGATT is described with additional reference to Figs. 9-15.

TATTACGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGAGGAAGT encoded by the human genome.

TG GAM336472 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336472 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336472 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336472 precursor RNA is designated SEQ ID:6014, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6014 is located from position 20299247 to position 20299338 relative to chromosome 15 on the `+` strand.

GAM336472 precursor RNA folds onto itself, forming GAM336472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336472 precursor RNA, designated SEQ ID NO: 6014, and a schematic representation of a predicted secondary folding of GAM336472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336472 folded precursor RNA yielding a GAM336472 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336472 RNA, hereby incorporated herein.

GAM336472 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336472 target RNA, herein designated GAM TARGET RNA.

GAM336472 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336472 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336472 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336472 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336472 RNA, herein designated GAM RNA, to target binding sites on GAM336472 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336472 target RNA into GAM336472 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336472 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336472 target genes. The mRNA of each one of this plurality of GAM336472 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336472 RNA, herein designated GAM RNA, and which when bound by GAM336472 RNA causes inhibition of translation of the GAM336472 target mRNA into a corresponding GAM336472 target protein.

The mechanism of the translational inhibition exerted by GAM336472 RNA, herein designated GAM RNA, on one or more GAM336472 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336472 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336472 RNA, herein designated GAM RNA, of GAM336472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336472 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336472 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336472

RNA correlate with, and may be deduced from, the identity of the GAM336472 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336474 6034 CATAGCTGTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGAGGCGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTTTCAGAA Messenger 336474 (GAM336474) oligonucleotides modulates expression of respective target
ACCATAGACA genes whose function and utility is known in the art.

TCTGAGAAAT GAM336474 is a novel bioinformatically detectable regulatory, non protein
ATGTTTCTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336474 was detected
CTTTTATG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336474 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336474 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336474 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336474 precursor RNA is designated SEQ ID:6034, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6034 is located from position 20354510 to position 20354577 relative to chromosome Y on the `-` strand.

GAM336474 precursor RNA folds onto itself, forming GAM336474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336474 precursor RNA, designated SEQ ID NO: 6034, and a schematic representation of a predicted secondary folding of GAM336474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336474 folded precursor RNA yielding a GAM336474 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336474 RNA, hereby incorporated herein.

GAM336474 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336474 target RNA, herein designated GAM TARGET RNA.

GAM336474 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336474 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336474 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336474 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336474 RNA, herein designated GAM RNA, to target binding sites on GAM336474 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336474 target RNA into GAM336474 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336474 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336474 target genes. The mRNA of each one of this plurality of GAM336474 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336474 RNA, herein designated GAM RNA, and which when bound by GAM336474 RNA causes inhibition of translation of the GAM336474 target mRNA into a corresponding GAM336474 target protein.

The mechanism of the translational inhibition exerted by GAM336474 RNA, herein designated GAM RNA, on one or more GAM336474 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336474 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336474 RNA, herein designated GAM RNA, of GAM336474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336474 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336474 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336474 RNA correlate with, and may be deduced from, the identity of the GAM336474 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336475 6672 GGAGAATGGC Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCGGAGG Messenger 336475 (GAM336475) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATTGT GAM336475 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336475 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336475 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336475 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336475 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336475 precursor RNA is designated SEQ ID:6672, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6672 is located from position 20384897 to position 20384984 relative to chromosome 15 on the `+` strand.

GAM336475 precursor RNA folds onto itself, forming GAM336475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336475 precursor RNA, designated SEQ ID NO: 6672, and a schematic representation of a predicted secondary folding of GAM336475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336475 folded precursor RNA yielding a GAM336475 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336475 RNA, hereby incorporated herein. Expression of GAM336475 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336475 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336475 target RNA, herein designated GAM TARGET RNA.

GAM336475 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336475 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336475 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336475 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336475 RNA, herein designated GAM RNA, to target binding sites on GAM336475 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336475 target RNA into GAM336475 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336475 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336475 target genes. The mRNA of each one of this plurality of GAM336475 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336475 RNA, herein designated GAM RNA, and which when bound by GAM336475 RNA causes inhibition of translation of the GAM336475 target mRNA into a corresponding GAM336475 target protein.

The mechanism of the translational inhibition exerted by GAM336475 RNA, herein designated GAM RNA, on one or more GAM336475 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336475 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336475 RNA, herein designated GAM RNA, of GAM336475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336475 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336475 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336475 RNA correlate with, and may be deduced from, the identity of the GAM336475 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACAGCAGGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGGATGAGG encoded by the human genome.

ATGGAAGTGT GAM336476 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AC GAM336476 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336476 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336476 precursor RNA is designated SEQ ID:6902, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6902 is located from position 20417307 to position 20417408 relative to chromosome 17 on the `-` strand.

GAM336476 precursor RNA folds onto itself, forming GAM336476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336476 precursor RNA, designated SEQ ID NO: 6902, and a schematic representation of a predicted secondary folding of GAM336476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336476 folded precursor RNA yielding a GAM336476 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336476 RNA, hereby incorporated herein.

GAM336476 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336476 target RNA, herein designated GAM TARGET RNA.

GAM336476 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336476 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336476 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336476 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336476 RNA, herein designated GAM RNA, to target binding sites on GAM336476 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336476 target RNA into GAM336476 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336476 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336476 target genes. The mRNA of each one of this plurality of GAM336476 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336476 RNA, herein designated GAM RNA, and which when bound by GAM336476 RNA causes inhibition of translation of the GAM336476 target mRNA into a corresponding GAM336476 target protein.

The mechanism of the translational inhibition exerted by GAM336476 RNA, herein designated GAM RNA, on one or more GAM336476 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336476 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336476 RNA, herein designated GAM RNA, of GAM336476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336476 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336476 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336476 RNA correlate with, and may be deduced from, the identity of the GAM336476 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTGTGGATC GAM336477 is a novel bioinformatically detectable regulatory, non protein

AGTGTCCTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336477 was detected

CACATTCCCG is described with additional reference to Figs. 9-15.

CAGGGTGTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCCTGGCACT encoded by the human genome.

ATCATAC GAM336477 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336477 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336477 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336477 precursor RNA is designated SEQ ID:6910, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6910 is located from position 20421189 to position 20421285 relative to chromosome 16 on the `+` strand.

GAM336477 precursor RNA folds onto itself, forming GAM336477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336477 precursor RNA, designated SEQ ID NO: 6910, and a schematic representation of a predicted secondary folding of GAM336477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336477 folded precursor RNA yielding a GAM336477 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336477 RNA, hereby incorporated herein.

GAM336477 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336477 target RNA, herein designated GAM TARGET RNA.

GAM336477 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336477 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336477 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336477 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336477 RNA, herein designated GAM RNA, to target binding sites on GAM336477 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336477 target RNA into GAM336477 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336477 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336477 target genes. The mRNA of each one of this plurality of GAM336477 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336477 RNA, herein designated GAM RNA, and which when bound by GAM336477 RNA causes inhibition of translation of the GAM336477 target mRNA into a corresponding GAM336477 target protein.

The mechanism of the translational inhibition exerted by GAM336477 RNA, herein designated GAM RNA, on one or more GAM336477 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336477 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336477 RNA, herein designated GAM RNA, of GAM336477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336477 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336477 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336477 RNA correlate with, and may be deduced from, the identity of the GAM336477 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336478 7192 TGATGTGTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTAGGAAAAT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTAAGGTGG Messenger 336478 (GAM336478) oligonucleotides modulates expression of respective target

GATGTGTGGA genes whose function and utility is known in the art.

TCAGTGTCCT GAM336478 is a novel bioinformatically detectable regulatory, non protein

AGCACATTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336478 was detected

CGCAGGGTGT is described with additional reference to Figs. 9-15.

AAGCCTGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTATCA encoded by the human genome.

GAM336478 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336478 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336478 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336478 precursor RNA is designated SEQ ID:7192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7192 is located from position 20421197 to position 20421282 relative to chromosome 16 on the `+` strand.

GAM336478 precursor RNA folds onto itself, forming GAM336478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336478 precursor RNA, designated SEQ ID NO: 7192, and a schematic representation of a predicted secondary folding of GAM336478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336478 folded precursor RNA yielding a GAM336478 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336478 RNA, hereby incorporated herein.

GAM336478 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336478 target RNA, herein designated GAM TARGET RNA.

GAM336478 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336478 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336478 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336478 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336478 RNA, herein designated GAM RNA, to target binding sites on GAM336478 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336478 target RNA into GAM336478 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336478 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336478 target genes. The mRNA of each one of this plurality of GAM336478 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336478 RNA, herein designated GAM RNA, and which when bound by GAM336478 RNA causes inhibition of translation of the GAM336478 target mRNA into a corresponding GAM336478 target protein.

The mechanism of the translational inhibition exerted by GAM336478 RNA, herein designated GAM RNA, on one or more GAM336478 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336478 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336478 RNA, herein designated GAM RNA, of GAM336478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336478 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336478 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336478 RNA correlate with, and may be deduced from, the identity of the GAM336478 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336479 6911 GTGGACTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGTGTGTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGAAAATAT Messenger 336479 (GAM336479) oligonucleotides modulates expression of respective target

TAAGGTGGGA genes whose function and utility is known in the art.

TGTGTGGATC GAM336479 is a novel bioinformatically detectable regulatory, non protein
AGTGTCCTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336479 was detected
CACATTCCCG is described with additional reference to Figs. 9-15.

CAGGGTGTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCCTGGCACT encoded by the human genome.

ATCATAC GAM336479 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336479 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336479 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336479 precursor RNA is designated SEQ ID:6911, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6911 is located from position 20480066 to position 20480162 relative to chromosome 16 on the `-` strand.

GAM336479 precursor RNA folds onto itself, forming GAM336479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336479 precursor RNA, designated SEQ ID NO: 6911, and a schematic representation of a predicted secondary folding of GAM336479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336479 folded precursor RNA yielding a GAM336479 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336479 RNA, hereby incorporated herein.

GAM336479 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336479 target RNA, herein designated GAM TARGET RNA.

GAM336479 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336479 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336479 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336479 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336479 RNA, herein designated GAM RNA, to target binding sites on GAM336479 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336479 target RNA into GAM336479 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336479 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336479 target genes. The mRNA of each one of this plurality of GAM336479 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336479 RNA, herein designated GAM RNA, and which when bound by GAM336479 RNA causes inhibition of translation of the GAM336479 target mRNA into a corresponding GAM336479 target protein.

The mechanism of the translational inhibition exerted by GAM336479 RNA, herein designated GAM RNA, on one or more GAM336479 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336479 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336479 RNA, herein designated GAM RNA, of GAM336479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336479 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336479 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336479 RNA correlate with, and may be deduced from, the identity of the GAM336479 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336480 7193 TGATGTGTGT Fig. 8 further provides a conceptual description of another novel bioinformatically
GTAGGAAAAT detected oligonucleotides of the present invention, referred to here as Genomic Address
ATTAAGGTGG Messenger 336480 (GAM336480) oligonucleotides modulates expression of respective target
GATGTGTGGA genes whose function and utility is known in the art.

TCAGTGTCCT GAM336480 is a novel bioinformatically detectable regulatory, non protein
AGCACATTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336480 was detected
CGCAGGGTGT is described with additional reference to Figs. 9-15.

AAGCCTGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTATCA encoded by the human genome.

GAM336480 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336480 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336480 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336480 precursor RNA is designated SEQ ID:7193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7193 is located from position 20480069 to position 20480154 relative to chromosome 16 on the `-` strand.

GAM336480 precursor RNA folds onto itself, forming GAM336480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336480 precursor RNA, designated SEQ ID NO: 7193, and a schematic representation of a predicted secondary folding of GAM336480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336480 folded precursor RNA yielding a GAM336480 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336480 RNA, hereby incorporated herein.

GAM336480 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336480 target RNA, herein designated GAM TARGET RNA.

GAM336480 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336480 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336480 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336480 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336480 RNA, herein designated GAM RNA, to target binding sites on GAM336480 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336480 target RNA into GAM336480 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336480 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336480 target genes. The mRNA of each one of this plurality of GAM336480 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336480 RNA, herein designated GAM RNA, and which when bound by GAM336480 RNA causes inhibition of translation of the GAM336480 target mRNA into a corresponding GAM336480 target protein.

The mechanism of the translational inhibition exerted by GAM336480 RNA, herein designated GAM RNA, on one or more GAM336480 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336480 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336480 RNA, herein designated GAM RNA, of GAM336480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336480 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336480 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336480 RNA correlate with, and may be deduced from, the identity of the GAM336480 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGTTAACATT GAM336483 is a novel bioinformatically detectable regulatory, non protein
TGCTAACTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336483 was detected
CAGTCTTATG is described with additional reference to Figs. 9-15.

GCTCCTTACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGCTGA encoded by the human genome.

GAM336483 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336483 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336483 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336483 precursor RNA is designated SEQ ID:7331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7331 is located from position 20641538 to position 20641624 relative to chromosome 8 on the `+` strand.

GAM336483 precursor RNA folds onto itself, forming GAM336483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336483 precursor RNA, designated SEQ ID NO: 7331, and a schematic representation of a predicted secondary folding of GAM336483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336483 folded precursor RNA yielding a GAM336483 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336483 RNA, hereby incorporated herein.

GAM336483 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336483 target RNA, herein designated GAM TARGET RNA.

GAM336483 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336483 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336483 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336483 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336483 RNA, herein designated GAM RNA, to target binding sites on GAM336483 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336483 target RNA into GAM336483 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336483 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336483 target genes. The mRNA of each one of this plurality of GAM336483 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336483 RNA, herein designated GAM RNA, and which when bound by GAM336483 RNA causes inhibition of translation of the GAM336483 target mRNA into a corresponding GAM336483 target protein.

The mechanism of the translational inhibition exerted by GAM336483 RNA, herein designated GAM RNA, on one or more GAM336483 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336483 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336483 RNA, herein designated GAM RNA, of GAM336483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336483 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336483 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336483 RNA correlate with, and may be deduced from, the identity of the GAM336483 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGGCCAGTA GAM336484 is a novel bioinformatically detectable regulatory, non protein
TTAGGAGGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336484 was detected
TAGCTCCAGA is described with additional reference to Figs. 9-15.

GATTCTAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTGGGGTCA encoded by the human genome.

GGGATCT GAM336484 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336484 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336484 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336484 precursor RNA is designated SEQ ID:5737, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5737 is located from position 20790820 to position 20790916 relative to chromosome 12 on the `+` strand.

GAM336484 precursor RNA folds onto itself, forming GAM336484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336484 precursor RNA, designated SEQ ID NO: 5737, and a schematic representation of a predicted secondary folding of GAM336484 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336484 folded precursor RNA yielding a GAM336484 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336484 RNA, hereby incorporated herein.

GAM336484 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336484 target RNA, herein designated GAM TARGET RNA.

GAM336484 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336484 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336484 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336484 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336484 RNA, herein designated GAM RNA, to target binding sites on GAM336484 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336484 target RNA into GAM336484 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336484 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336484 target genes. The mRNA of each one of this plurality of GAM336484 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336484 RNA, herein designated GAM RNA, and which when bound by GAM336484 RNA causes inhibition of translation of the GAM336484 target mRNA into a corresponding GAM336484 target protein.

The mechanism of the translational inhibition exerted by GAM336484 RNA, herein designated GAM RNA, on one or more GAM336484 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336484 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336484 RNA, herein designated GAM RNA, of GAM336484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336484 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336484 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336484 RNA correlate with, and may be deduced from, the identity of the GAM336484 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336486 5799 AGGTTGGTAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGTGGTTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TAACACAGTA Messenger 336486 (GAM336486) oligonucleotides modulates expression of respective target

TCTCTTCTTT genes whose function and utility is known in the art.

TAGGTGTTCA GAM336486 is a novel bioinformatically detectable regulatory, non protein

GTGGAATCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336486 was detected

ACTTACAAAA is described with additional reference to Figs. 9-15.

TTTGGAGGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGTGGTGTT encoded by the human genome.

GGCTTTTGCC GAM336486 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAATCT GAM336486 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336486 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336486 precursor RNA is designated SEQ ID:5799, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5799 is located from position 21001411 to position 21001516 relative to chromosome 18 on the `-` strand.

GAM336486 precursor RNA folds onto itself, forming GAM336486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336486 precursor RNA, designated SEQ ID NO: 5799, and a schematic representation of a predicted secondary folding of GAM336486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336486 folded precursor RNA yielding a GAM336486 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336486 RNA, hereby incorporated herein.

GAM336486 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336486 target RNA, herein designated GAM TARGET RNA.

GAM336486 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336486 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336486 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336486 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336486 RNA, herein designated GAM RNA, to target binding sites on GAM336486 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336486 target RNA into GAM336486 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336486 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336486 target genes. The mRNA of each one of this plurality of GAM336486 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336486 RNA, herein designated GAM RNA, and which when bound by GAM336486 RNA causes inhibition of translation of the GAM336486 target mRNA into a corresponding GAM336486 target protein.

The mechanism of the translational inhibition exerted by GAM336486 RNA, herein designated GAM RNA, on one or more GAM336486 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336486 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336486 RNA, herein designated GAM RNA, of GAM336486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336486 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336486 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336486 RNA correlate with, and may be deduced from, the identity of the GAM336486 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336487 5676 AATGGCTAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TAAGGGAAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCATTCATT Messenger 336487 (GAM336487) oligonucleotides modulates expression of respective target

TATTCATTCA genes whose function and utility is known in the art.

ACTAATATT GAM336487 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336487 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336487 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336487 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336487 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336487 precursor RNA is designated SEQ ID:5676, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:5676 is located from position 21104974 to position 21105023 relative to chromosome 5 on the `-` strand.

GAM336487 precursor RNA folds onto itself, forming GAM336487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336487 precursor RNA, designated SEQ ID NO: 5676, and a schematic representation of a predicted secondary folding of GAM336487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336487 folded precursor RNA yielding a GAM336487 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336487 RNA, hereby incorporated herein. Expression of GAM336487 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336487 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336487 target RNA, herein designated GAM TARGET RNA.

GAM336487 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336487 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336487 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336487 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336487 RNA, herein designated GAM RNA, to target binding sites on GAM336487 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336487 target RNA into GAM336487 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336487 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336487 target genes. The mRNA of each one of this plurality of GAM336487 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336487 RNA, herein designated GAM RNA, and which when bound by GAM336487 RNA causes inhibition of translation of the GAM336487 target mRNA into a corresponding GAM336487 target protein.

The mechanism of the translational inhibition exerted by GAM336487 RNA, herein designated GAM RNA, on one or more GAM336487 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336487 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336487 RNA, herein designated GAM RNA, of GAM336487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336487 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336487 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336487 RNA correlate with, and may be deduced from, the identity of the GAM336487 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336488 5749 AGCCCTAATA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTATAATTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GAACTGTACT Messenger 336488 (GAM336488) oligonucleotides modulates expression of respective target

GGACCCATAG genes whose function and utility is known in the art.

TTTTAACTGA GAM336488 is a novel bioinformatically detectable regulatory, non protein

AAAGGGCCAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336488 was detected

ACAAGTGGTG is described with additional reference to Figs. 9-15.

TCTGTCCAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCTGGACTG encoded by the human genome.

GGCT GAM336488 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336488 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336488 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336488 precursor RNA is designated SEQ ID:5749, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5749 is located from position 21165273 to position 21165366 relative to chromosome 22 on the `-` strand.

GAM336488 precursor RNA folds onto itself, forming GAM336488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336488 precursor RNA, designated SEQ ID NO: 5749, and a schematic representation of a predicted secondary folding of GAM336488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336488 folded precursor RNA yielding a GAM336488 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336488 RNA, hereby incorporated herein.

GAM336488 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336488 target RNA, herein designated GAM TARGET RNA.

GAM336488 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336488 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336488 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336488 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336488 RNA, herein designated GAM RNA, to target binding sites on GAM336488 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336488 target RNA into GAM336488 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336488 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336488 target genes. The mRNA of each one of this plurality of GAM336488 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336488 RNA, herein designated GAM RNA, and which when bound by GAM336488 RNA causes inhibition of translation of the GAM336488 target mRNA into a corresponding GAM336488 target protein.

The mechanism of the translational inhibition exerted by GAM336488 RNA, herein designated GAM RNA, on one or more GAM336488 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336488 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336488 RNA, herein designated GAM RNA, of GAM336488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336488 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336488 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336488 RNA correlate with, and may be deduced from, the identity of the GAM336488 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336489 5844 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336489 (GAM336489) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336489 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336489 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336489 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336489 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336489 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336489 precursor RNA is designated SEQ ID:5844, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5844 is located from position 21185062 to position 21185143 relative to chromosome 12 on the `+` strand.

GAM336489 precursor RNA folds onto itself, forming GAM336489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336489 precursor RNA, designated SEQ ID NO: 5844, and a schematic representation of a predicted secondary folding of GAM336489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336489 folded precursor RNA yielding a GAM336489 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336489 RNA, hereby incorporated herein.

GAM336489 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336489 target RNA, herein designated GAM TARGET RNA.

GAM336489 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336489 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336489 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336489 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336489 RNA, herein designated GAM RNA, to target binding sites on GAM336489 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336489 target RNA into GAM336489 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336489 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336489 target genes. The mRNA of each one of this plurality of GAM336489 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336489 RNA, herein designated GAM RNA, and which when bound by GAM336489 RNA causes inhibition of translation of the GAM336489 target mRNA into a corresponding GAM336489 target protein.

The mechanism of the translational inhibition exerted by GAM336489 RNA, herein designated GAM RNA, on one or more GAM336489 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336489 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336489 RNA, herein designated GAM RNA, of GAM336489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336489 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336489 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336489 RNA correlate with, and may be deduced from, the identity of the GAM336489 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336490 6634 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 336490 (GAM336490) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGGTCAC GAM336490 is a novel bioinformatically detectable regulatory, non protein
ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336490 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336490 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336490 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336490 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336490 precursor RNA is designated SEQ ID:6634, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6634 is located from position 21350021 to position 21350108 relative to chromosome 5 on the `-` strand.

GAM336490 precursor RNA folds onto itself, forming GAM336490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336490 precursor RNA, designated SEQ ID NO: 6634, and a schematic representation of a predicted secondary folding of GAM336490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336490 folded precursor RNA yielding a GAM336490 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336490 RNA, hereby incorporated herein. Expression of GAM336490 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336490 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336490 target RNA, herein designated GAM TARGET RNA.

GAM336490 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336490 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336490 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336490 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336490 RNA, herein designated GAM RNA, to target binding sites on GAM336490 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336490 target RNA into GAM336490 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336490 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336490 target genes. The mRNA of each one of this plurality of GAM336490 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336490 RNA, herein designated GAM RNA, and which when bound by GAM336490 RNA causes inhibition of translation of the GAM336490 target mRNA into a corresponding GAM336490 target protein.

The mechanism of the translational inhibition exerted by GAM336490 RNA, herein designated GAM RNA, on one or more GAM336490 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336490 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336490 RNA, herein designated GAM RNA, of GAM336490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336490 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336490 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336490 RNA correlate with, and may be deduced from, the identity of the GAM336490 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336491 6562 GCTTGAACCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGGATGTGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GGTTGTAGTG Messenger 336491 (GAM336491) oligonucleotides modulates expression of respective target
AGCTGAGATT genes whose function and utility is known in the art.

GGGCCATTGC GAM336491 is a novel bioinformatically detectable regulatory, non protein
ACTCCAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336491 was detected
GGGCAACAAG is described with additional reference to Figs. 9-15.

AGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336491 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336491 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336491 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336491 precursor RNA is designated SEQ ID:6562, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6562 is located from position 21374719 to position 21374791 relative to chromosome 21 on the `+` strand.

GAM336491 precursor RNA folds onto itself, forming GAM336491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336491 precursor RNA, designated SEQ ID NO: 6562, and a schematic representation of a predicted secondary folding of GAM336491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336491 folded precursor RNA yielding a GAM336491 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336491 RNA, hereby incorporated herein. Expression of GAM336491 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336491 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336491 target RNA, herein designated GAM TARGET RNA.

GAM336491 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336491 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336491 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336491 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336491 RNA, herein designated GAM RNA, to target binding sites on GAM336491 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336491 target RNA into GAM336491 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336491 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336491 target genes. The mRNA of each one of this plurality of GAM336491 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336491 RNA, herein designated GAM RNA, and which when bound by GAM336491 RNA causes inhibition of translation of the GAM336491 target mRNA into a corresponding GAM336491 target protein.

The mechanism of the translational inhibition exerted by GAM336491 RNA, herein designated GAM RNA, on one or more GAM336491 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336491 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336491 RNA, herein designated GAM RNA, of GAM336491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336491 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336491 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336491 RNA correlate with, and may be deduced from, the identity of the GAM336491 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336492 6593 GGACTACAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CACATGCAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CACGTCTGGC Messenger 336492 (GAM336492) oligonucleotides modulates expression of respective target

TAATTTTCTT genes whose function and utility is known in the art.

GAGTTTTAGT GAM336492 is a novel bioinformatically detectable regulatory, non protein

AGAGACTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336492 was detected

TCTCGTTATG is described with additional reference to Figs. 9-15.

TTGTCCAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTCCCGAG encoded by the human genome.

CTCCTGAGTT GAM336492 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM336492 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336492 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336492 precursor RNA is designated SEQ ID:6593, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6593 is located from position 21380738 to position 21380838 relative to chromosome 16 on the `-` strand.

GAM336492 precursor RNA folds onto itself, forming GAM336492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336492 precursor RNA, designated SEQ ID NO: 6593, and a schematic representation of a predicted secondary folding of GAM336492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336492 folded precursor RNA yielding a GAM336492 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336492 RNA, hereby incorporated herein.

GAM336492 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336492 target RNA, herein designated GAM TARGET RNA.

GAM336492 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336492 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336492 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336492 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336492 RNA, herein designated GAM RNA, to target binding sites on GAM336492 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336492 target RNA into GAM336492 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336492 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336492 target genes. The mRNA of each one of this plurality of GAM336492 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336492 RNA, herein designated GAM RNA, and which when bound by GAM336492 RNA causes inhibition of translation of the GAM336492 target mRNA into a corresponding GAM336492 target protein.

The mechanism of the translational inhibition exerted by GAM336492 RNA, herein

designated GAM RNA, on one or more GAM336492 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336492 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336492 RNA, herein designated GAM RNA, of GAM336492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336492 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336492 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336492 RNA correlate with, and may be deduced from, the identity of the GAM336492 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336493 6741 GGCATGGTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCTCTGATA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCCTAGCTA Messenger 336493 (GAM336493) oligonucleotides modulates expression of respective target

CTCAGGAGGC genes whose function and utility is known in the art.

TGAGCCTAGT GAM336493 is a novel bioinformatically detectable regulatory, non protein

AGTTAGAGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336493 was detected

TGCAGTGAAC is described with additional reference to Figs. 9-15.

TATGATTGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CC encoded by the human genome.

GAM336493 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336493 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336493 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336493 precursor RNA is designated SEQ ID:6741, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6741 is located from position 21401896 to position 21401977

relative to chromosome 14 on the `-` strand.

GAM336493 precursor RNA folds onto itself, forming GAM336493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336493 precursor RNA, designated SEQ ID NO: 6741, and a schematic representation of a predicted secondary folding of GAM336493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336493 folded precursor RNA yielding a GAM336493 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336493 RNA, hereby incorporated herein.

GAM336493 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336493 target RNA, herein designated GAM TARGET RNA.

GAM336493 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336493 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336493 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336493 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336493 RNA, herein designated GAM RNA, to target binding sites on GAM336493 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336493 target RNA into GAM336493 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336493 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336493 target genes. The mRNA of each one of this plurality of GAM336493 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336493 RNA, herein designated GAM RNA, and which when bound by GAM336493 RNA causes inhibition of translation of the GAM336493 target mRNA into a corresponding GAM336493 target protein.

The mechanism of the translational inhibition exerted by GAM336493 RNA, herein designated GAM RNA, on one or more GAM336493 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336493 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336493 RNA, herein designated GAM RNA, of GAM336493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336493 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336493 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336493 RNA correlate with, and may be deduced from, the identity of the GAM336493 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336494 7029 TCCCTATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGCAGCTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGACGTCA Messenger 336494 (GAM336494) oligonucleotides modulates expression of respective target

TTGAGAGATA genes whose function and utility is known in the art.

AATTAGGTAC GAM336494 is a novel bioinformatically detectable regulatory, non protein

AAGTGGGCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336494 was detected

AGAATTGTAT is described with additional reference to Figs. 9-15.

GTGAGGTTAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGA encoded by the human genome.

GAM336494 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336494 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336494 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336494 precursor RNA is designated SEQ ID:7029, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7029 is located from position 21775643 to position 21775725 relative to chromosome 21 on the `+` strand.

GAM336494 precursor RNA folds onto itself, forming GAM336494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336494 precursor RNA, designated SEQ ID NO: 7029, and a schematic representation of a predicted secondary folding of GAM336494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336494 folded precursor RNA yielding a GAM336494 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336494 RNA, hereby incorporated herein.

GAM336494 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336494 target RNA, herein designated GAM TARGET RNA.

GAM336494 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336494 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336494 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336494 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336494 RNA, herein designated GAM RNA, to target

binding sites on GAM336494 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336494 target RNA into GAM336494 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336494 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336494 target genes. The mRNA of each one of this plurality of GAM336494 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336494 RNA, herein designated GAM RNA, and which when bound by GAM336494 RNA causes inhibition of translation of the GAM336494 target mRNA into a corresponding GAM336494 target protein.

The mechanism of the translational inhibition exerted by GAM336494 RNA, herein designated GAM RNA, on one or more GAM336494 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336494 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336494 RNA, herein designated GAM RNA, of GAM336494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336494 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336494 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336494 RNA correlate with, and may be deduced from, the identity of the GAM336494 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336495 6594 GGACTACAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CACATGCAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAGACTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336495 was detected

TCTCGTTATG is described with additional reference to Figs. 9-15.

TTGTCCAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTCCCGAG encoded by the human genome.

CTCCTGAGTT GAM336495 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM336495 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336495 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336495 precursor RNA is designated SEQ ID:6594, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6594 is located from position 21813001 to position 21813101 relative to chromosome 16 on the `-` strand.

GAM336495 precursor RNA folds onto itself, forming GAM336495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336495 precursor RNA, designated SEQ ID NO: 6594, and a schematic representation of a predicted secondary folding of GAM336495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336495 folded precursor RNA yielding a GAM336495 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336495 RNA, hereby incorporated herein.

GAM336495 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336495 target RNA, herein designated GAM TARGET RNA.

GAM336495 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336495 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336495 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336495 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336495 RNA, herein designated GAM RNA, to target binding sites on GAM336495 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336495 target RNA into GAM336495 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336495 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336495 target genes. The mRNA of each one of this plurality of GAM336495 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336495 RNA, herein designated GAM RNA, and which when bound by GAM336495 RNA causes inhibition of translation of the GAM336495 target mRNA into a corresponding GAM336495 target protein.

The mechanism of the translational inhibition exerted by GAM336495 RNA, herein designated GAM RNA, on one or more GAM336495 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336495 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336495 RNA, herein designated GAM RNA, of GAM336495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336495 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336495 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336495 RNA correlate with, and may be deduced from, the identity of the GAM336495 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336496 5845 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336496 (GAM336496) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336496 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336496 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336496 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336496 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336496 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336496 precursor RNA is designated SEQ ID:5845, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5845 is located from position 21821931 to position 21822012 relative to chromosome 18 on the `-` strand.

GAM336496 precursor RNA folds onto itself, forming GAM336496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336496 precursor RNA, designated SEQ ID NO: 5845, and a schematic representation of a predicted secondary folding of GAM336496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336496 folded precursor RNA yielding a GAM336496 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336496 RNA, hereby incorporated herein.

GAM336496 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336496 target RNA, herein designated GAM TARGET RNA.

GAM336496 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336496 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336496 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336496 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336496 RNA, herein designated GAM RNA, to target binding sites on GAM336496 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336496 target RNA into GAM336496 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336496 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336496 target genes. The mRNA of each one of this plurality of GAM336496 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336496 RNA, herein designated GAM RNA, and which when bound by GAM336496 RNA causes inhibition of translation of the GAM336496 target mRNA into a corresponding GAM336496 target protein.

The mechanism of the translational inhibition exerted by GAM336496 RNA, herein designated GAM RNA, on one or more GAM336496 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336496 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336496 RNA, herein designated GAM RNA, of GAM336496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336496 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336496 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336496

RNA correlate with, and may be deduced from, the identity of the GAM336496 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336497 (GAM336497) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336497 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336497 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336497 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336497 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336497 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336497 precursor RNA is designated SEQ ID:7344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7344 is located from position 21935927 to position 21936033 relative to chromosome 8 on the `+` strand.

GAM336497 precursor RNA folds onto itself, forming GAM336497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336497 precursor RNA, designated SEQ ID NO: 7344, and a schematic representation of a predicted secondary folding of GAM336497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336497 folded precursor RNA yielding a GAM336497 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336497 RNA, hereby incorporated herein.

GAM336497 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336497 target RNA, herein designated GAM TARGET RNA.

GAM336497 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336497 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336497 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336497 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336497 RNA, herein designated GAM RNA, to target binding sites on GAM336497 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336497 target RNA into GAM336497 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336497 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336497 target genes. The mRNA of each one of this plurality of GAM336497 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336497 RNA, herein designated GAM RNA, and which when bound by GAM336497 RNA causes inhibition of translation of the GAM336497 target mRNA into a corresponding GAM336497 target protein.

The mechanism of the translational inhibition exerted by GAM336497 RNA, herein designated GAM RNA, on one or more GAM336497 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336497 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336497 RNA, herein designated GAM RNA, of GAM336497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336497 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336497 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336497 RNA correlate with, and may be deduced from, the identity of the GAM336497 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336498 6010 CAGAATGTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

ACATGTGCAT Messenger 336498 (GAM336498) oligonucleotides modulates expression of respective target
CAGCAGTGCA genes whose function and utility is known in the art.

TTTGTAGTTA GAM336498 is a novel bioinformatically detectable regulatory, non protein
AATGTGTAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336498 was detected
TAACGTTCTG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336498 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336498 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336498 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336498 precursor RNA is designated SEQ ID:6010, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6010 is located from position 21935946 to position 21936015 relative to chromosome 8 on the `+` strand.

GAM336498 precursor RNA folds onto itself, forming GAM336498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336498 precursor RNA, designated SEQ ID NO: 6010, and a schematic representation of a predicted secondary folding of GAM336498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336498 folded precursor RNA yielding a GAM336498 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336498 RNA, hereby incorporated herein.

GAM336498 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336498 target RNA, herein designated GAM TARGET RNA.

GAM336498 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336498 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336498 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336498 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336498 RNA, herein designated GAM RNA, to target binding sites on GAM336498 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336498 target RNA into GAM336498 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336498 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336498 target genes. The mRNA of each one of this plurality of GAM336498 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336498 RNA, herein designated GAM RNA, and which when bound by GAM336498 RNA causes inhibition of translation of the GAM336498 target mRNA into a corresponding GAM336498 target protein.

The mechanism of the translational inhibition exerted by GAM336498 RNA, herein designated GAM RNA, on one or more GAM336498 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336498 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336498 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336498 RNA, herein designated GAM RNA, of GAM336498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336498 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336498 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336498 RNA correlate with, and may be deduced from, the identity of the GAM336498 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGAATGCCAG GAM336499 is a novel bioinformatically detectable regulatory, non protein

CATCATTTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336499 was detected

CTCAAATGCC is described with additional reference to Figs. 9-15.

ACTTGTTACG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGCTTCCACT encoded by the human genome.

CTTTTATTCT GAM336499 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTCTGAGGAC GAM336499 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

AT GAM336499 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336499 precursor RNA is designated SEQ ID:6916, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6916 is located from position 21981294 to position 21981405 relative to chromosome 10 on the `+` strand.

GAM336499 precursor RNA folds onto itself, forming GAM336499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336499 precursor RNA, designated SEQ ID NO: 6916, and a schematic representation of a predicted secondary folding of GAM336499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336499 folded precursor RNA yielding a GAM336499 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336499 RNA, hereby incorporated herein.

GAM336499 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336499 target RNA, herein designated GAM TARGET RNA.

GAM336499 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336499 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336499 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336499 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336499 RNA, herein designated GAM RNA, to target binding sites on GAM336499 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336499 target RNA into GAM336499 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336499 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336499 target genes. The mRNA of each one of this plurality of GAM336499 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336499 RNA, herein designated GAM RNA, and which when bound by GAM336499 RNA causes inhibition of translation of the GAM336499 target mRNA into a corresponding GAM336499 target protein.

The mechanism of the translational inhibition exerted by GAM336499 RNA, herein designated GAM RNA, on one or more GAM336499 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336499 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336499 RNA, herein designated GAM RNA, of GAM336499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336499 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336499 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336499 RNA correlate with, and may be deduced from, the identity of the GAM336499 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACCTGGGGCT is described with additional reference to Figs. 9-15.

GGCTGTTTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336502 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336502 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336502 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336502 precursor RNA is designated SEQ ID:6050, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6050 is located from position 22350120 to position 22350199 relative to chromosome 22 on the `-` strand.

GAM336502 precursor RNA folds onto itself, forming GAM336502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336502 precursor RNA, designated SEQ ID NO: 6050, and a schematic representation of a predicted secondary folding of GAM336502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336502 folded precursor RNA yielding a GAM336502 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336502 RNA, hereby incorporated herein.

GAM336502 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336502 target RNA, herein designated GAM TARGET RNA.

GAM336502 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336502 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336502 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336502 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336502 RNA, herein designated GAM RNA, to target binding sites on GAM336502 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336502 target RNA into GAM336502 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336502 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336502 target genes. The mRNA of each one of this plurality of GAM336502 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336502 RNA, herein designated GAM RNA, and which when bound by GAM336502 RNA causes inhibition of translation of the GAM336502 target mRNA into a corresponding GAM336502 target protein.

The mechanism of the translational inhibition exerted by GAM336502 RNA, herein designated GAM RNA, on one or more GAM336502 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336502 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336502 RNA, herein designated GAM RNA, of GAM336502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336502 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336502 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336502 RNA correlate with, and may be deduced from, the identity of the GAM336502 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336503 6049 CCACGTGGAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TACTGGGCTC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTCTCAGTGT Messenger 336503 (GAM336503) oligonucleotides modulates expression of respective target

GGAAGCTGAT genes whose function and utility is known in the art.

TTCCAACAAG GAM336503 is a novel bioinformatically detectable regulatory, non protein

GAGCATTCAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336503 was detected

AGATTAGGAG is described with additional reference to Figs. 9-15.

TTCCCAGTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCATAAGTGG encoded by the human genome.

GAM336503 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336503 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336503 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336503 precursor RNA is designated SEQ ID:6049, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6049 is located from position 22360083 to position 22360172 relative to chromosome 13 on the `-` strand.

GAM336503 precursor RNA folds onto itself, forming GAM336503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336503 precursor RNA, designated SEQ ID NO: 6049, and a schematic representation of a predicted secondary folding of GAM336503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336503 folded precursor RNA yielding a GAM336503 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336503 RNA, hereby incorporated herein.

GAM336503 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336503 target RNA, herein designated GAM TARGET RNA.

GAM336503 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336503 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336503 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336503 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336503 RNA, herein designated GAM RNA, to target binding sites on GAM336503 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336503 target RNA into GAM336503 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336503 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336503 target genes. The mRNA of each one of this plurality of GAM336503 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336503 RNA, herein designated GAM RNA, and which when bound by GAM336503 RNA causes inhibition of translation of the GAM336503 target mRNA into a corresponding GAM336503 target protein.

The mechanism of the translational inhibition exerted by GAM336503 RNA, herein designated GAM RNA, on one or more GAM336503 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336503 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336503 RNA, herein designated GAM RNA, of GAM336503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336503 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336503 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336503 RNA correlate with, and may be deduced from, the identity of the GAM336503 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336504 6500 GCATCTTGAC Fig. 8 further provides a conceptual description of another novel bioinformatically

ACATGTTCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCTCCAGGT Messenger 336504 (GAM336504) oligonucleotides modulates expression of respective target

CCCAGTAACT genes whose function and utility is known in the art.

GTGCCCATCC GAM336504 is a novel bioinformatically detectable regulatory, non protein

ATTGTTACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336504 was detected

CAGGTCACAG is described with additional reference to Figs. 9-15.

TGGCCCTGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTGGGGCAT encoded by the human genome.

TATACTCTCT GAM336504 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTTGGTGT GAM336504 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336504 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336504 precursor RNA is designated SEQ ID:6500, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6500 is located from position 22376839 to position 22376946 relative to chromosome 13 on the `-` strand.

GAM336504 precursor RNA folds onto itself, forming GAM336504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336504 precursor RNA, designated SEQ ID NO: 6500, and a schematic representation of a predicted secondary folding of GAM336504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336504 folded precursor RNA yielding a GAM336504 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336504 RNA, hereby incorporated herein.

GAM336504 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336504 target RNA, herein designated GAM TARGET RNA.

GAM336504 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336504 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336504 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336504 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336504 RNA, herein designated GAM RNA, to target binding sites on GAM336504 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336504 target RNA into GAM336504 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336504 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336504 target genes. The mRNA of each one of this plurality of GAM336504 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336504 RNA, herein designated GAM RNA, and which when bound by GAM336504 RNA causes inhibition of translation of the GAM336504 target mRNA into a corresponding GAM336504 target protein.

The mechanism of the translational inhibition exerted by GAM336504 RNA, herein designated GAM RNA, on one or more GAM336504 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336504 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336504 RNA, herein designated GAM RNA, of GAM336504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336504 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336504 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336504 RNA correlate with, and may be deduced from, the identity of the GAM336504 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336505 6581 GGAAGTGAAA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGGGAAGTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTCTCCCCA Messenger 336505 (GAM336505) oligonucleotides modulates expression of respective target

CAGTTACCAT GAM336505 is a novel bioinformatically detectable regulatory, non protein
GAGGATGGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336505 was detected
AGTTTCTTCC is described with additional reference to Figs. 9-15.

CTTTCCGTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTCACTTTC encoded by the human genome.

GAM336505 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336505 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336505 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336505 precursor RNA is designated SEQ ID:6581, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6581 is located from position 22426100 to position 22426188 relative to chromosome 14 on the `+` strand.

GAM336505 precursor RNA folds onto itself, forming GAM336505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336505 precursor RNA, designated SEQ ID NO: 6581, and a schematic representation of a predicted secondary folding of GAM336505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336505 folded precursor RNA yielding a GAM336505 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336505 RNA, hereby incorporated herein.

GAM336505 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336505 target RNA, herein designated GAM TARGET RNA.

GAM336505 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336505 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336505 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336505 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336505 RNA, herein designated GAM RNA, to target binding sites on GAM336505 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336505 target RNA into GAM336505 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336505 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336505 target genes. The mRNA of each one of this plurality of GAM336505 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336505 RNA, herein designated GAM RNA, and which when bound by GAM336505 RNA causes inhibition of translation of the GAM336505 target mRNA into a corresponding GAM336505 target protein.

The mechanism of the translational inhibition exerted by GAM336505 RNA, herein designated GAM RNA, on one or more GAM336505 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336505 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336505 RNA, herein designated GAM RNA, of GAM336505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336505 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336505 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336505 RNA correlate with, and may be deduced from, the identity of the GAM336505 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336506 6595 GGACTACAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAGACTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336506 was detected
TCTCGTTATG is described with additional reference to Figs. 9-15.

TTGTCCAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGTCCCGAG encoded by the human genome.

CTCCTGAGTT GAM336506 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
C GAM336506 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336506 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336506 precursor RNA is designated SEQ ID:6595, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6595 is located from position 22435583 to position 22435683 relative to chromosome 16 on the `+` strand.

GAM336506 precursor RNA folds onto itself, forming GAM336506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336506 precursor RNA, designated SEQ ID NO: 6595, and a schematic representation of a predicted secondary folding of GAM336506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336506 folded precursor RNA yielding a GAM336506 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336506 RNA, hereby incorporated herein.

GAM336506 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336506 target RNA, herein designated GAM TARGET RNA.

GAM336506 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336506 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336506 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336506 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336506 RNA, herein designated GAM RNA, to target binding sites on GAM336506 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336506 target RNA into GAM336506 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336506 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336506 target genes. The mRNA of each one of this plurality of GAM336506 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336506 RNA, herein designated GAM RNA, and which when bound by GAM336506 RNA causes inhibition of translation of the GAM336506 target mRNA into a corresponding GAM336506 target protein.

The mechanism of the translational inhibition exerted by GAM336506 RNA, herein designated GAM RNA, on one or more GAM336506 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336506 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336506 RNA, herein designated GAM RNA, of GAM336506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336506 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336506 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336506 RNA correlate with, and may be deduced from, the identity of the GAM336506 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTATATAAAA GAM336507 is a novel bioinformatically detectable regulatory, non protein
CAAAACCCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336507 was detected
AAGCTTATAA is described with additional reference to Figs. 9-15.

TTCAGTAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAAACAGAC encoded by the human genome.

AGTAAAC GAM336507 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336507 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336507 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336507 precursor RNA is designated SEQ ID:6946, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6946 is located from position 22440215 to position 22440311 relative to chromosome 10 on the `-` strand.

GAM336507 precursor RNA folds onto itself, forming GAM336507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336507 precursor RNA, designated SEQ ID NO: 6946, and a schematic representation of a predicted secondary folding of GAM336507 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336507 folded precursor RNA yielding a GAM336507 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336507 RNA, hereby incorporated herein.

GAM336507 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336507 target RNA, herein designated GAM TARGET RNA.

GAM336507 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336507 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336507 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336507 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336507 RNA, herein designated GAM RNA, to target binding sites on GAM336507 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336507 target RNA into GAM336507 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336507 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336507 target genes. The mRNA of each one of this plurality of GAM336507 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336507 RNA, herein designated GAM RNA, and which when bound by GAM336507 RNA causes inhibition of translation of the GAM336507 target mRNA into a corresponding GAM336507 target protein.

The mechanism of the translational inhibition exerted by GAM336507 RNA, herein designated GAM RNA, on one or more GAM336507 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336507 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336507 RNA, herein designated GAM RNA, of GAM336507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336507 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336507 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336507 RNA correlate with, and may be deduced from, the identity of the GAM336507 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336508 6945 GTTTGGTGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TATTGGATTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TAAGCATTGG Messenger 336508 (GAM336508) oligonucleotides modulates expression of respective target

GAGTTGACCT genes whose function and utility is known in the art.

TTATATAAAA GAM336508 is a novel bioinformatically detectable regulatory, non protein

CAAAACCCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336508 was detected

AAGCTTATAA is described with additional reference to Figs. 9-15.

TTCAGTAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAAACAGAC encoded by the human genome.

GAM336508 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336508 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336508 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336508 precursor RNA is designated SEQ ID:6945, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6945 is located from position 22440222 to position 22440311 relative to chromosome 10 on the `-` strand.

GAM336508 precursor RNA folds onto itself, forming GAM336508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336508 precursor RNA, designated SEQ ID NO: 6945, and a schematic representation of a predicted secondary folding of GAM336508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336508 folded precursor RNA yielding a GAM336508 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336508 RNA, hereby incorporated herein.

GAM336508 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336508 target RNA, herein designated GAM TARGET RNA.

GAM336508 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336508 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336508 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336508 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336508 RNA, herein designated GAM RNA, to target binding sites on GAM336508 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336508 target RNA into GAM336508 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336508 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336508 target genes. The mRNA of each one of this plurality of GAM336508 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336508 RNA, herein designated GAM RNA, and which when bound by GAM336508 RNA causes inhibition of translation of the GAM336508 target mRNA into a corresponding GAM336508 target protein.

The mechanism of the translational inhibition exerted by GAM336508 RNA, herein designated GAM RNA, on one or more GAM336508 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336508 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336508 RNA, herein designated GAM RNA, of GAM336508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336508 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336508 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336508 RNA correlate with, and may be deduced from, the identity of the GAM336508 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336509 7321 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGGGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGTAG Messenger 336509 (GAM336509) oligonucleotides modulates expression of respective target

TGAGCCGAGA genes whose function and utility is known in the art.

TCGCGCCACT GAM336509 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336509 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

G GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336509 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336509 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336509 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336509 precursor RNA is designated SEQ

ID:7321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7321 is located from position 22444388 to position 22444458 relative to chromosome 22 on the `+` strand.

GAM336509 precursor RNA folds onto itself, forming GAM336509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336509 precursor RNA, designated SEQ ID NO: 7321, and a schematic representation of a predicted secondary folding of GAM336509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336509 folded precursor RNA yielding a GAM336509 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336509 RNA, hereby incorporated herein. Expression of GAM336509 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336509 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336509 target RNA, herein designated GAM TARGET RNA.

GAM336509 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336509 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336509 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336509 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336509 RNA, herein designated GAM RNA, to target binding sites on GAM336509 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336509 target RNA

into GAM336509 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336509 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336509 target genes. The mRNA of each one of this plurality of GAM336509 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336509 RNA, herein designated GAM RNA, and which when bound by GAM336509 RNA causes inhibition of translation of the GAM336509 target mRNA into a corresponding GAM336509 target protein.

The mechanism of the translational inhibition exerted by GAM336509 RNA, herein designated GAM RNA, on one or more GAM336509 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336509 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336509 RNA, herein designated GAM RNA, of GAM336509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336509 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336509 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336509 RNA correlate with, and may be deduced from, the identity of the GAM336509 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336510 6596 GGACTACAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
CACATGCAAC detected oligonucleotides of the present invention, referred to here as Genomic Address
CACGTCTGGC Messenger 336510 (GAM336510) oligonucleotides modulates expression of respective target
TAATTTTCTT genes whose function and utility is known in the art.

GAGTTTTAGT GAM336510 is a novel bioinformatically detectable regulatory, non protein
AGAGACTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336510 was detected
TCTCGTTATG is described with additional reference to Figs. 9-15.

TTGTCCAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTCCCGAG encoded by the human genome.

CTCCTGAGTT GAM336510 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM336510 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336510 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336510 precursor RNA is designated SEQ ID:6596, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6596 is located from position 22480967 to position 22481067 relative to chromosome 16 on the `+` strand.

GAM336510 precursor RNA folds onto itself, forming GAM336510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336510 precursor RNA, designated SEQ ID NO: 6596, and a schematic representation of a predicted secondary folding of GAM336510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336510 folded precursor RNA yielding a GAM336510 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336510 RNA, hereby incorporated herein.

GAM336510 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336510 target RNA, herein designated GAM TARGET RNA.

GAM336510 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336510 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336510 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336510 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336510 RNA, herein designated GAM RNA, to target binding sites on GAM336510 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336510 target RNA into GAM336510 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336510 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336510 target genes. The mRNA of each one of this plurality of GAM336510 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336510 RNA, herein designated GAM RNA, and which when bound by GAM336510 RNA causes inhibition of translation of the GAM336510 target mRNA into a corresponding GAM336510 target protein.

The mechanism of the translational inhibition exerted by GAM336510 RNA, herein designated GAM RNA, on one or more GAM336510 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336510 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336510 RNA, herein designated GAM RNA, of GAM336510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336510 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336510 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336510 RNA correlate with, and may be deduced from, the identity of the GAM336510 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336511 5846 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336511 (GAM336511) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336511 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336511 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336511 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336511 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336511 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336511 precursor RNA is designated SEQ ID:5846, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5846 is located from position 22524532 to position 22524613 relative to chromosome 5 on the `+` strand.

GAM336511 precursor RNA folds onto itself, forming GAM336511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336511 precursor RNA, designated SEQ ID NO: 5846, and a schematic representation of a predicted secondary folding of GAM336511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336511 folded precursor RNA yielding a GAM336511 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336511 RNA, hereby incorporated herein.

GAM336511 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336511 target RNA, herein designated GAM TARGET RNA.

GAM336511 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336511 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336511 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336511 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336511 RNA, herein designated GAM RNA, to target binding sites on GAM336511 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336511 target RNA into GAM336511 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336511 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336511 target genes. The mRNA of each one of this plurality of GAM336511 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336511 RNA, herein designated GAM RNA, and which when bound by GAM336511 RNA causes inhibition of translation of the GAM336511 target mRNA into a corresponding GAM336511 target protein.

The mechanism of the translational inhibition exerted by GAM336511 RNA, herein designated GAM RNA, on one or more GAM336511 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336511 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336511 RNA, herein designated GAM RNA, of GAM336511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336511 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336511 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336511 RNA correlate with, and may be deduced from, the identity of the GAM336511 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336512 6987 TATTGGTTTC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTCTTGGTA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAGAAATCAT Messenger 336512 (GAM336512) oligonucleotides modulates expression of respective target

AAAAGTCCAG genes whose function and utility is known in the art.

GACAGAAAGT GAM336512 is a novel bioinformatically detectable regulatory, non protein

GACCTATAGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336512 was detected

GATGACCTGG is described with additional reference to Figs. 9-15.

CCTCTTGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTTCTTTGC encoded by the human genome.

TTCTGGAAAG GAM336512 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CAGTA GAM336512 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336512 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336512 precursor RNA is designated SEQ ID:6987, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6987 is located from position 22572448 to position 22572552 relative to chromosome 18 on the `+` strand.

GAM336512 precursor RNA folds onto itself, forming GAM336512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336512 precursor RNA, designated SEQ ID NO: 6987, and a schematic representation of a predicted secondary folding of GAM336512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336512 folded precursor RNA yielding a GAM336512 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336512 RNA, hereby incorporated herein.

GAM336512 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336512 target RNA, herein designated GAM TARGET RNA.

GAM336512 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336512 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336512 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336512 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336512 RNA, herein designated GAM RNA, to target binding sites on GAM336512 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336512 target RNA into GAM336512 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336512 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336512 target genes. The mRNA of each one of this plurality of GAM336512 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336512 RNA, herein designated GAM RNA, and which when bound by GAM336512 RNA causes inhibition of translation of the GAM336512 target mRNA into a corresponding GAM336512 target protein.

The mechanism of the translational inhibition exerted by GAM336512 RNA, herein designated GAM RNA, on one or more GAM336512 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336512 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336512 RNA, herein designated GAM RNA, of GAM336512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336512 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336512 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336512 RNA correlate with, and may be deduced from, the identity of the GAM336512 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336513 5976 ATGTTATGAT Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTTTCATTT detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTGGAAATA Messenger 336513 (GAM336513) oligonucleotides modulates expression of respective target
AGGAAAACTT genes whose function and utility is known in the art.

GCATGGTTTG GAM336513 is a novel bioinformatically detectable regulatory, non protein
AATTGTGGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336513 was detected
CAATAGGTGG is described with additional reference to Figs. 9-15.

TGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336513 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336513 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336513 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336513 precursor RNA is designated SEQ ID:5976, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5976 is located from position 22650373 to position 22650445 relative to chromosome 15 on the `+` strand.

GAM336513 precursor RNA folds onto itself, forming GAM336513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336513 precursor RNA, designated SEQ ID NO: 5976, and a schematic representation of a predicted secondary folding of GAM336513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336513 folded precursor RNA yielding a GAM336513 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336513 RNA, hereby incorporated herein.

GAM336513 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336513 target RNA, herein designated GAM TARGET RNA.

GAM336513 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336513 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336513 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336513 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336513 RNA, herein designated GAM RNA, to target binding sites on GAM336513 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336513 target RNA into GAM336513 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336513 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336513 target genes. The mRNA of each one of this plurality of GAM336513 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336513 RNA, herein designated GAM RNA, and which when bound by GAM336513 RNA causes inhibition of translation of the GAM336513 target mRNA into a corresponding GAM336513 target protein.

The mechanism of the translational inhibition exerted by GAM336513 RNA, herein designated GAM RNA, on one or more GAM336513 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336513 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336513 RNA, herein designated GAM RNA, of GAM336513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336513 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336513 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336513 RNA correlate with, and may be deduced from, the identity of the GAM336513 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336514 6332 GAGAATTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACCCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTGGAGGT Messenger 336514 (GAM336514) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CGAGATTGCA GAM336514 is a novel bioinformatically detectable regulatory, non protein

CCATTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336514 was detected

CCACCCTAGG is described with additional reference to Figs. 9-15.

CAACAAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAAACTC encoded by the human genome.

GAM336514 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336514 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336514 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336514 precursor RNA is designated SEQ ID:6332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6332 is located from position 22660392 to position 22660478 relative to chromosome 15 on the `+` strand.

GAM336514 precursor RNA folds onto itself, forming GAM336514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336514 precursor RNA, designated SEQ ID NO: 6332, and a schematic representation of a predicted secondary folding of GAM336514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336514 folded precursor RNA yielding a GAM336514 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336514 RNA, hereby incorporated herein.

GAM336514 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336514 target RNA, herein designated GAM TARGET RNA.

GAM336514 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336514 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336514 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336514 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336514 RNA, herein designated GAM RNA, to target binding sites on GAM336514 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336514 target RNA into GAM336514 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336514 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336514 target genes. The mRNA of each one of this plurality of GAM336514 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336514 RNA, herein designated GAM RNA, and which when bound by GAM336514 RNA causes inhibition of translation of the GAM336514 target mRNA into a corresponding GAM336514 target protein.

The mechanism of the translational inhibition exerted by GAM336514 RNA, herein designated GAM RNA, on one or more GAM336514 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336514 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336514 RNA, herein designated GAM RNA, of GAM336514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336514 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336514 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336514 RNA correlate with, and may be deduced from, the identity of the GAM336514 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336516 5755 AGGAAGATTG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTGAGTCCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GGAATTGGAG Messenger 336516 (GAM336516) oligonucleotides modulates expression of respective target
GCTGCAGTGA genes whose function and utility is known in the art.

GCTATAATTG GAM336516 is a novel bioinformatically detectable regulatory, non protein
TGCCAACTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336516 was detected
ACTCCAGCCT is described with additional reference to Figs. 9-15.

GGGCAACAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAGACCCT encoded by the human genome.

GAM336516 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336516 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336516 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336516 precursor RNA is designated SEQ ID:5755, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5755 is located from position 22796154 to position 22796241 relative to chromosome 22 on the `+` strand.

GAM336516 precursor RNA folds onto itself, forming GAM336516 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336516 precursor RNA, designated SEQ ID NO: 5755, and a schematic representation of a predicted secondary folding of GAM336516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336516 folded precursor RNA yielding a GAM336516 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336516 RNA, hereby incorporated herein.

GAM336516 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336516 target RNA, herein designated GAM TARGET RNA.

GAM336516 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336516 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336516 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336516 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336516 RNA, herein designated GAM RNA, to target binding sites on GAM336516 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336516 target RNA into GAM336516 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336516 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336516 target genes. The mRNA of each one of this plurality of GAM336516 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336516 RNA,

herein designated GAM RNA, and which when bound by GAM336516 RNA causes inhibition of translation of the GAM336516 target mRNA into a corresponding GAM336516 target protein.

The mechanism of the translational inhibition exerted by GAM336516 RNA, herein designated GAM RNA, on one or more GAM336516 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336516 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336516 RNA, herein designated GAM RNA, of GAM336516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336516 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336516 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336516 RNA correlate with, and may be deduced from, the identity of the GAM336516 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336518 6504 GCCCCTGCCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGAGATCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CTTTATTTTC Messenger 336518 (GAM336518) oligonucleotides modulates expression of respective target

ATCTCACCCA genes whose function and utility is known in the art.

GAATATTGAG GAM336518 is a novel bioinformatically detectable regulatory, non protein

GTGATCAGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336518 was detected

AGGTGGAGTG is described with additional reference to Figs. 9-15.

GTTGGGAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGT encoded by the human genome.

GAM336518 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336518 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336518 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336518 precursor RNA is designated SEQ ID:6504, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6504 is located from position 22950966 to position 22951048 relative to chromosome 15 on the `+` strand.

GAM336518 precursor RNA folds onto itself, forming GAM336518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336518 precursor RNA, designated SEQ ID NO: 6504, and a schematic representation of a predicted secondary folding of GAM336518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336518 folded precursor RNA yielding a GAM336518 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336518 RNA, hereby incorporated herein.

GAM336518 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336518 target RNA, herein designated GAM TARGET RNA.

GAM336518 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336518 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336518 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336518 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336518 RNA, herein designated GAM RNA, to target binding sites on GAM336518 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336518 target RNA

into GAM336518 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336518 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336518 target genes. The mRNA of each one of this plurality of GAM336518 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336518 RNA, herein designated GAM RNA, and which when bound by GAM336518 RNA causes inhibition of translation of the GAM336518 target mRNA into a corresponding GAM336518 target protein.

The mechanism of the translational inhibition exerted by GAM336518 RNA, herein designated GAM RNA, on one or more GAM336518 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336518 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336518 RNA, herein designated GAM RNA, of GAM336518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336518 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336518 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336518 RNA correlate with, and may be deduced from, the identity of the GAM336518 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336519 5847 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336519 (GAM336519) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336519 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336519 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336519 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336519 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336519 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336519 precursor RNA is designated SEQ ID:5847, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5847 is located from position 23259601 to position 23259682 relative to chromosome 18 on the `-` strand.

GAM336519 precursor RNA folds onto itself, forming GAM336519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336519 precursor RNA, designated SEQ ID NO: 5847, and a schematic representation of a predicted secondary folding of GAM336519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336519 folded precursor RNA yielding a GAM336519 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336519 RNA, hereby incorporated herein.

GAM336519 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336519 target RNA, herein designated GAM TARGET RNA.

GAM336519 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336519 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336519 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336519 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336519 RNA, herein designated GAM RNA, to target binding sites on GAM336519 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336519 target RNA into GAM336519 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336519 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336519 target genes. The mRNA of each one of this plurality of GAM336519 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336519 RNA, herein designated GAM RNA, and which when bound by GAM336519 RNA causes inhibition of translation of the GAM336519 target mRNA into a corresponding GAM336519 target protein.

The mechanism of the translational inhibition exerted by GAM336519 RNA, herein designated GAM RNA, on one or more GAM336519 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336519 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336519 RNA, herein designated GAM RNA, of GAM336519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336519 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336519 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336519 RNA correlate with, and may be deduced from, the identity of the GAM336519 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336520 6555 GCTTCACTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTTTGGGAAA Messenger 336520 (GAM336520) oligonucleotides modulates expression of respective target

TAAGCTGATA genes whose function and utility is known in the art.

GTAAAGTCAT GAM336520 is a novel bioinformatically detectable regulatory, non protein
GTAACACTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336520 was detected
CTGTGCAGGT is described with additional reference to Figs. 9-15.

TAACATTTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGACCTTGCT encoded by the human genome.

TTCCTTCTCA GAM336520 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GTGTATGC GAM336520 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336520 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336520 precursor RNA is designated SEQ ID:6555, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6555 is located from position 23264637 to position 23264744 relative to chromosome 19 on the `-` strand.

GAM336520 precursor RNA folds onto itself, forming GAM336520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336520 precursor RNA, designated SEQ ID NO: 6555, and a schematic representation of a predicted secondary folding of GAM336520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336520 folded precursor RNA yielding a GAM336520 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336520 RNA, hereby incorporated herein.

GAM336520 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336520 target RNA, herein designated GAM TARGET RNA.

GAM336520 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336520 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336520 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336520 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336520 RNA, herein designated GAM RNA, to target binding sites on GAM336520 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336520 target RNA into GAM336520 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336520 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336520 target genes. The mRNA of each one of this plurality of GAM336520 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336520 RNA, herein designated GAM RNA, and which when bound by GAM336520 RNA causes inhibition of translation of the GAM336520 target mRNA into a corresponding GAM336520 target protein.

The mechanism of the translational inhibition exerted by GAM336520 RNA, herein designated GAM RNA, on one or more GAM336520 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336520 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336520 RNA, herein designated GAM RNA, of GAM336520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336520 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336520 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336520 RNA correlate with, and may be deduced from, the identity of the GAM336520 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336522 5790 AGGGTGCTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCTTCTAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTTTTGAGA Messenger 336522 (GAM336522) oligonucleotides modulates expression of respective target

GCATAGAGCC genes whose function and utility is known in the art.

AGGAAGCATA GAM336522 is a novel bioinformatically detectable regulatory, non protein

CACACATTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336522 was detected

TGGCTCCTGA is described with additional reference to Figs. 9-15.

CTTTTTGCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTCCCAGGT encoded by the human genome.

TATTGAGTTT GAM336522 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GCCCCT GAM336522 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336522 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336522 precursor RNA is designated SEQ ID:5790, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5790 is located from position 23295481 to position 23295586 relative to chromosome X on the `+` strand.

GAM336522 precursor RNA folds onto itself, forming GAM336522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336522 precursor RNA, designated SEQ ID NO: 5790, and a schematic representation of a predicted secondary folding of GAM336522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336522 folded precursor RNA yielding a GAM336522 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336522 RNA, hereby incorporated herein.

GAM336522 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336522 target RNA, herein designated GAM TARGET RNA.

GAM336522 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336522 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336522 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336522 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336522 RNA, herein designated GAM RNA, to target binding sites on GAM336522 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336522 target RNA into GAM336522 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336522 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336522 target genes. The mRNA of each one of this plurality of GAM336522 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336522 RNA, herein designated GAM RNA, and which when bound by GAM336522 RNA causes inhibition of translation of the GAM336522 target mRNA into a corresponding GAM336522 target protein.

The mechanism of the translational inhibition exerted by GAM336522 RNA, herein designated GAM RNA, on one or more GAM336522 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336522 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336522 RNA, herein designated GAM RNA, of GAM336522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336522 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336522 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336522 RNA correlate with, and may be deduced from, the identity of the GAM336522 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336523 5848 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336523 (GAM336523) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336523 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336523 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336523 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336523 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336523 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336523 precursor RNA is designated SEQ ID:5848, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5848 is located from position 23320241 to position 23320322 relative to chromosome 12 on the `-` strand.

GAM336523 precursor RNA folds onto itself, forming GAM336523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336523 precursor RNA, designated SEQ ID NO: 5848, and a schematic representation of a predicted secondary folding of GAM336523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336523 folded precursor

RNA yielding a GAM336523 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336523 RNA, hereby incorporated herein.

GAM336523 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336523 target RNA, herein designated GAM TARGET RNA.

GAM336523 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336523 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336523 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336523 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336523 RNA, herein designated GAM RNA, to target binding sites on GAM336523 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336523 target RNA into GAM336523 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336523 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336523 target genes. The mRNA of each one of this plurality of GAM336523 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336523 RNA, herein designated GAM RNA, and which when bound by GAM336523 RNA causes inhibition of translation of the GAM336523 target mRNA into a corresponding GAM336523 target protein.

The mechanism of the translational inhibition exerted by GAM336523 RNA, herein designated GAM RNA, on one or more GAM336523 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336523 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336523 RNA, herein designated GAM RNA, of GAM336523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336523 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336523 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336523 RNA correlate with, and may be deduced from, the identity of the GAM336523 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336524 6134 CGAACCAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAAGTAATG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTGCCAGGA Messenger 336524 (GAM336524) oligonucleotides modulates expression of respective target

CAAGAGACGC genes whose function and utility is known in the art.

ACCCAGAGCC GAM336524 is a novel bioinformatically detectable regulatory, non protein

TCTGGCCTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336524 was detected

GTCTCCTATC is described with additional reference to Figs. 9-15.

CTGGCTCACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGCACACTCC encoded by the human genome.

AAGTTTG GAM336524 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336524 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336524 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336524 precursor RNA is designated SEQ ID:6134, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6134 is located from position 23523635 to position 23523731 relative to chromosome 16 on the `-` strand.

GAM336524 precursor RNA folds onto itself, forming GAM336524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336524 precursor RNA, designated SEQ ID NO: 6134, and a schematic representation of a predicted secondary folding of GAM336524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336524 folded precursor RNA yielding a GAM336524 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336524 RNA, hereby incorporated herein.

GAM336524 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336524 target RNA, herein designated GAM TARGET RNA.

GAM336524 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336524 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336524 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336524 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336524 RNA, herein designated GAM RNA, to target binding sites on GAM336524 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336524 target RNA into GAM336524 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336524 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336524 target genes. The mRNA of each one of this plurality of GAM336524 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336524 RNA, herein designated GAM RNA, and which when bound by GAM336524 RNA causes inhibition of translation of the GAM336524 target mRNA into a corresponding GAM336524 target protein.

The mechanism of the translational inhibition exerted by GAM336524 RNA, herein designated GAM RNA, on one or more GAM336524 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336524 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336524 RNA, herein designated GAM RNA, of GAM336524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336524 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336524 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336524 RNA correlate with, and may be deduced from, the identity of the GAM336524 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336526 6984 TATGTCACCA Fig. 8 further provides a conceptual description of another novel bioinformatically

AATTTGGTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTTTCTCCT Messenger 336526 (GAM336526) oligonucleotides modulates expression of respective target

TTGCCTGCTG genes whose function and utility is known in the art.

CTTCTTTCAA GAM336526 is a novel bioinformatically detectable regulatory, non protein

GTAGGACATG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336526 was detected

GAGACAACAG is described with additional reference to Figs. 9-15.

CCAAATTTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTTCAGTGA encoded by the human genome.

TGTG GAM336526 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336526 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336526 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336526 precursor RNA is designated SEQ ID:6984, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6984 is located from position 23528432 to position 23528525

relative to chromosome X on the `-` strand.

GAM336526 precursor RNA folds onto itself, forming GAM336526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336526 precursor RNA, designated SEQ ID NO: 6984, and a schematic representation of a predicted secondary folding of GAM336526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336526 folded precursor RNA yielding a GAM336526 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336526 RNA, hereby incorporated herein.

GAM336526 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336526 target RNA, herein designated GAM TARGET RNA.

GAM336526 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336526 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336526 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336526 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336526 RNA, herein designated GAM RNA, to target binding sites on GAM336526 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336526 target RNA into GAM336526 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336526 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336526 target genes. The mRNA of each one of this plurality of GAM336526 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336526 RNA, herein designated GAM RNA, and which when bound by GAM336526 RNA causes inhibition of translation of the GAM336526 target mRNA into a corresponding GAM336526 target protein.

The mechanism of the translational inhibition exerted by GAM336526 RNA, herein designated GAM RNA, on one or more GAM336526 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336526 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336526 RNA, herein designated GAM RNA, of GAM336526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336526 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336526 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336526 RNA correlate with, and may be deduced from, the identity of the GAM336526 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336527 5985 CAAATTTGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTTGCCTGC Messenger 336527 (GAM336527) oligonucleotides modulates expression of respective target

TGCTTCTTTC genes whose function and utility is known in the art.

AAGTAGGACA GAM336527 is a novel bioinformatically detectable regulatory, non protein

TGGAGACAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336527 was detected

AGCCAAATTT is described with additional reference to Figs. 9-15.

G GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336527 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336527 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336527 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336527 precursor RNA is designated SEQ ID:5985, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5985 is located from position 23528447 to position 23528517 relative to chromosome X on the `-` strand.

GAM336527 precursor RNA folds onto itself, forming GAM336527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336527 precursor RNA, designated SEQ ID NO: 5985, and a schematic representation of a predicted secondary folding of GAM336527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336527 folded precursor RNA yielding a GAM336527 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336527 RNA, hereby incorporated herein.

GAM336527 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336527 target RNA, herein designated GAM TARGET RNA.

GAM336527 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336527 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336527 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336527 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336527 RNA, herein designated GAM RNA, to target

binding sites on GAM336527 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336527 target RNA into GAM336527 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336527 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336527 target genes. The mRNA of each one of this plurality of GAM336527 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336527 RNA, herein designated GAM RNA, and which when bound by GAM336527 RNA causes inhibition of translation of the GAM336527 target mRNA into a corresponding GAM336527 target protein.

The mechanism of the translational inhibition exerted by GAM336527 RNA, herein designated GAM RNA, on one or more GAM336527 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336527 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336527 RNA, herein designated GAM RNA, of GAM336527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336527 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336527 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336527 RNA correlate with, and may be deduced from, the identity of the GAM336527 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336528 6169 CTCCTTAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTATCAATC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGGTGCCCT Messenger 336528 (GAM336528) oligonucleotides modulates expression of respective target

TCCATTGTAT genes whose function and utility is known in the art.

CACATCCTTG GAM336528 is a novel bioinformatically detectable regulatory, non protein

GATCACAGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336528 was detected

ATGGGTTCAG is described with additional reference to Figs. 9-15.

GAATAGACAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATGACCCAAG encoded by the human genome.

GGAG GAM336528 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336528 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336528 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336528 precursor RNA is designated SEQ ID:6169, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6169 is located from position 24199772 to position 24199865 relative to chromosome 22 on the `+` strand.

GAM336528 precursor RNA folds onto itself, forming GAM336528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336528 precursor RNA, designated SEQ ID NO: 6169, and a schematic representation of a predicted secondary folding of GAM336528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336528 folded precursor RNA yielding a GAM336528 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336528 RNA, hereby incorporated herein.

GAM336528 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336528 target RNA, herein designated GAM TARGET RNA.

GAM336528 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336528 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336528 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336528 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336528 RNA, herein designated GAM RNA, to target binding sites on GAM336528 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336528 target RNA into GAM336528 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336528 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336528 target genes. The mRNA of each one of this plurality of GAM336528 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336528 RNA, herein designated GAM RNA, and which when bound by GAM336528 RNA causes inhibition of translation of the GAM336528 target mRNA into a corresponding GAM336528 target protein.

The mechanism of the translational inhibition exerted by GAM336528 RNA, herein designated GAM RNA, on one or more GAM336528 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336528 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336528 RNA, herein designated GAM RNA, of GAM336528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336528 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336528 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336528 RNA correlate with, and may be deduced from, the identity of the GAM336528 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336529 6125 CCTTAGGTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TATCAATCCT detected oligonucleotides of the present invention, referred to here as Genomic Address
GGTGCCCTTC Messenger 336529 (GAM336529) oligonucleotides modulates expression of respective target
CATTGTATCA genes whose function and utility is known in the art.

CATCCTTGGA GAM336529 is a novel bioinformatically detectable regulatory, non protein
TCACAGTGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336529 was detected
GGGTTCAGGA is described with additional reference to Figs. 9-15.

ATAGACACAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GACCCAAGG encoded by the human genome.

GAM336529 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336529 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336529 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336529 precursor RNA is designated SEQ ID:6125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6125 is located from position 24199774 to position 24199862 relative to chromosome 22 on the `+` strand.

GAM336529 precursor RNA folds onto itself, forming GAM336529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336529 precursor RNA, designated SEQ ID NO: 6125, and a schematic representation of a predicted secondary folding of GAM336529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336529 folded precursor RNA yielding a GAM336529 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336529 RNA, hereby incorporated herein.

GAM336529 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336529 target RNA, herein designated GAM TARGET RNA.

GAM336529 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336529 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336529 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336529 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336529 RNA, herein designated GAM RNA, to target binding sites on GAM336529 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336529 target RNA into GAM336529 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336529 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336529 target genes. The mRNA of each one of this plurality of GAM336529 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336529 RNA, herein designated GAM RNA, and which when bound by GAM336529 RNA causes inhibition of translation of the GAM336529 target mRNA into a corresponding GAM336529 target protein.

The mechanism of the translational inhibition exerted by GAM336529 RNA, herein designated GAM RNA, on one or more GAM336529 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336529 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336529 RNA, herein designated GAM RNA, of GAM336529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336529 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336529 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336529

RNA correlate with, and may be deduced from, the identity of the GAM336529 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336532 6365 GAGCTGTCCG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTCTGGGAA GAM336532 is a novel bioinformatically detectable regulatory, non protein
ATCATTAATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336532 was detected
CTTAACTCTG is described with additional reference to Figs. 9-15.

ATGACTGTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAAAGTAGTC encoded by the human genome.

ACTGACCACT GAM336532 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
C GAM336532 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336532 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336532 precursor RNA is designated SEQ ID:6365, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6365 is located from position 24278760 to position 24278860 relative to chromosome 15 on the `-` strand.

GAM336532 precursor RNA folds onto itself, forming GAM336532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336532 precursor RNA, designated SEQ ID NO: 6365, and a schematic representation of a predicted secondary folding of GAM336532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336532 folded precursor RNA yielding a GAM336532 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336532 RNA, hereby incorporated herein.

GAM336532 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336532 target RNA, herein designated GAM TARGET RNA.

GAM336532 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336532 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336532 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336532 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336532 RNA, herein designated GAM RNA, to target binding sites on GAM336532 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336532 target RNA into GAM336532 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336532 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336532 target genes. The mRNA of each one of this plurality of GAM336532 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336532 RNA, herein designated GAM RNA, and which when bound by GAM336532 RNA causes inhibition of translation of the GAM336532 target mRNA into a corresponding GAM336532 target protein.

The mechanism of the translational inhibition exerted by GAM336532 RNA, herein designated GAM RNA, on one or more GAM336532 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336532 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336532 RNA, herein designated GAM RNA, of GAM336532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336532 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336532 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336532 RNA correlate with, and may be deduced from, the identity of the GAM336532 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAAAAGTAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAC encoded by the human genome.

GAM336533 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336533 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336533 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336533 precursor RNA is designated SEQ ID:6894, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6894 is located from position 24278769 to position 24278851 relative to chromosome 15 on the `-` strand.

GAM336533 precursor RNA folds onto itself, forming GAM336533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336533 precursor RNA, designated SEQ ID NO: 6894, and a schematic representation of a predicted secondary folding of GAM336533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336533 folded precursor RNA yielding a GAM336533 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336533 RNA, hereby incorporated herein.

GAM336533 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336533 target RNA, herein designated GAM TARGET RNA.

GAM336533 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336533 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336533 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336533 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336533 RNA, herein designated GAM RNA, to target binding sites on GAM336533 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336533 target RNA into GAM336533 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336533 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336533 target genes. The mRNA of each one of this plurality of GAM336533 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336533 RNA, herein designated GAM RNA, and which when bound by GAM336533 RNA causes inhibition of translation of the GAM336533 target mRNA into a corresponding GAM336533 target protein.

The mechanism of the translational inhibition exerted by GAM336533 RNA, herein designated GAM RNA, on one or more GAM336533 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336533 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336533 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336533 RNA, herein designated GAM RNA, of GAM336533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336533 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336533 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336533 RNA correlate with, and may be deduced from, the identity of the GAM336533 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336534 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336534 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336534 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336534 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336534 precursor RNA is designated SEQ ID:6698, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6698 is located from position 24437886 to position 24437973 relative to chromosome 13 on the `-` strand.

GAM336534 precursor RNA folds onto itself, forming GAM336534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336534 precursor RNA, designated SEQ ID NO: 6698, and a schematic representation of a predicted secondary folding of GAM336534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336534 folded precursor RNA yielding a GAM336534 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336534 RNA, hereby incorporated herein. Expression of GAM336534 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336534 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336534 target RNA, herein designated GAM TARGET RNA.

GAM336534 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336534 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336534 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336534 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336534 RNA, herein designated GAM RNA, to target binding sites on GAM336534 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336534 target RNA into GAM336534 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336534 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336534 target genes. The mRNA of each one of this plurality of GAM336534 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336534 RNA, herein designated GAM RNA, and which when bound by GAM336534 RNA causes inhibition of translation of the GAM336534 target mRNA into a corresponding GAM336534 target protein.

The mechanism of the translational inhibition exerted by GAM336534 RNA, herein designated GAM RNA, on one or more GAM336534 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336534 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336534 RNA, herein designated GAM RNA, of GAM336534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336534 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336534 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336534 RNA correlate with, and may be deduced from, the identity of the GAM336534 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336535 6590 GGACCATTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAGGTGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGCAGCAGG Messenger 336535 (GAM336535) oligonucleotides modulates expression of respective target

ACCCCCAGAA genes whose function and utility is known in the art.

CCGAAGCCTG GAM336535 is a novel bioinformatically detectable regulatory, non protein

TGTCTCTGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336535 was detected

GTCTCATCCC is described with additional reference to Figs. 9-15.

TTCATTCTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

C encoded by the human genome.

GAM336535 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336535 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336535 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336535 precursor RNA is designated SEQ ID:6590, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6590 is located from position 24538340 to position 24538420 relative to chromosome 13 on the `+` strand.

GAM336535 precursor RNA folds onto itself, forming GAM336535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336535 precursor RNA, designated SEQ ID NO: 6590, and a schematic representation of a predicted secondary folding of GAM336535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336535 folded precursor RNA yielding a GAM336535 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336535 RNA, hereby incorporated herein.

GAM336535 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336535 target RNA, herein designated GAM TARGET RNA.

GAM336535 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336535 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336535 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336535 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336535 RNA, herein designated GAM RNA, to target binding sites on GAM336535 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336535 target RNA into GAM336535 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336535 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336535 target genes. The mRNA of each one of this plurality of GAM336535 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336535 RNA, herein designated GAM RNA, and which when bound by GAM336535 RNA causes inhibition of translation of the GAM336535 target mRNA into a corresponding GAM336535 target protein.

The mechanism of the translational inhibition exerted by GAM336535 RNA, herein designated GAM RNA, on one or more GAM336535 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336535 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336535 RNA, herein designated GAM RNA, of GAM336535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336535 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336535 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336535 RNA correlate with, and may be deduced from, the identity of the GAM336535 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336536 5849 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336536 (GAM336536) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336536 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336536 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336536 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336536 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336536 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336536 precursor RNA is designated SEQ ID:5849, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5849 is located from position 24634603 to position 24634684 relative to chromosome 11 on the `+` strand.

GAM336536 precursor RNA folds onto itself, forming GAM336536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336536 precursor RNA, designated SEQ ID NO: 5849, and a schematic representation of a predicted secondary folding of GAM336536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336536 folded precursor RNA yielding a GAM336536 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336536 RNA, hereby incorporated herein.

GAM336536 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336536 target RNA, herein designated GAM TARGET RNA.

GAM336536 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336536 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336536 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336536 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336536 RNA, herein designated GAM RNA, to target binding sites on GAM336536 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336536 target RNA into GAM336536 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336536 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336536 target genes. The mRNA of each one of this plurality of GAM336536 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336536 RNA, herein designated GAM RNA, and which when bound by GAM336536 RNA causes inhibition of translation of the GAM336536 target mRNA into a corresponding GAM336536 target protein.

The mechanism of the translational inhibition exerted by GAM336536 RNA, herein designated GAM RNA, on one or more GAM336536 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336536 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336536 RNA, herein designated GAM RNA, of GAM336536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336536 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336536 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336536 RNA correlate with, and may be deduced from, the identity of the GAM336536 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336537 5827 AGTTTAAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGCTCATGT detected oligonucleotides of the present invention, referred to here as Genomic Address

AGTACCCAGC Messenger 336537 (GAM336537) oligonucleotides modulates expression of respective target

TACTCTGGGC genes whose function and utility is known in the art.

GACTGAGCCC GAM336537 is a novel bioinformatically detectable regulatory, non protein
AGGGTACTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336537 was detected
GGGATCACTT is described with additional reference to Figs. 9-15.

GAGCCCAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCT encoded by the human genome.

GAM336537 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336537 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336537 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336537 precursor RNA is designated SEQ ID:5827, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5827 is located from position 24755757 to position 24755839 relative to chromosome 16 on the `+` strand.

GAM336537 precursor RNA folds onto itself, forming GAM336537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336537 precursor RNA, designated SEQ ID NO: 5827, and a schematic representation of a predicted secondary folding of GAM336537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336537 folded precursor RNA yielding a GAM336537 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336537 RNA, hereby incorporated herein.

GAM336537 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336537 target RNA, herein designated GAM TARGET RNA.

GAM336537 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336537 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336537 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336537 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336537 RNA, herein designated GAM RNA, to target binding sites on GAM336537 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336537 target RNA into GAM336537 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336537 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336537 target genes. The mRNA of each one of this plurality of GAM336537 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336537 RNA, herein designated GAM RNA, and which when bound by GAM336537 RNA causes inhibition of translation of the GAM336537 target mRNA into a corresponding GAM336537 target protein.

The mechanism of the translational inhibition exerted by GAM336537 RNA, herein designated GAM RNA, on one or more GAM336537 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336537 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336537 RNA, herein designated GAM RNA, of GAM336537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336537 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336537 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336537 RNA correlate with, and may be deduced from, the identity of the GAM336537 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336538 6942 GTTTAAGAAT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTACCCAGCT Messenger 336538 (GAM336538) oligonucleotides modulates expression of respective target
ACTCTGGGCG genes whose function and utility is known in the art.

ACTGAGCCCA GAM336538 is a novel bioinformatically detectable regulatory, non protein
GGGTACTCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336538 was detected
GGATCACTTG is described with additional reference to Figs. 9-15.

AGCCCAGGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
C encoded by the human genome.

GAM336538 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336538 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336538 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336538 precursor RNA is designated SEQ ID:6942, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6942 is located from position 24755758 to position 24755838 relative to chromosome 16 on the `+` strand.

GAM336538 precursor RNA folds onto itself, forming GAM336538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336538 precursor RNA, designated SEQ ID NO: 6942, and a schematic representation of a predicted secondary folding of GAM336538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336538 folded precursor RNA yielding a GAM336538 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336538 RNA, hereby incorporated herein.

GAM336538 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336538 target RNA, herein designated GAM TARGET RNA.

GAM336538 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336538 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336538 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336538 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336538 RNA, herein designated GAM RNA, to target binding sites on GAM336538 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336538 target RNA into GAM336538 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336538 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336538 target genes. The mRNA of each one of this plurality of GAM336538 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336538 RNA, herein designated GAM RNA, and which when bound by GAM336538 RNA causes inhibition of translation of the GAM336538 target mRNA into a corresponding GAM336538 target protein.

The mechanism of the translational inhibition exerted by GAM336538 RNA, herein designated GAM RNA, on one or more GAM336538 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336538 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336538 RNA, herein designated GAM RNA, of GAM336538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336538 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336538 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336538 RNA correlate with, and may be deduced from, the identity of the GAM336538 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACAGTCTTGT genes whose function and utility is known in the art.

TCATACATTG GAM336539 is a novel bioinformatically detectable regulatory, non protein
CCATTATATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336539 was detected
TAGTGCAGTT is described with additional reference to Figs. 9-15.

GAATGAACAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTCTGTGTC encoded by the human genome.

TGGGCTTAGG GAM336539 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TGC GAM336539 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336539 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336539 precursor RNA is designated SEQ ID:6905, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6905 is located from position 24906581 to position 24906683 relative to chromosome 10 on the `+` strand.

GAM336539 precursor RNA folds onto itself, forming GAM336539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336539 precursor RNA, designated SEQ ID NO: 6905, and a schematic representation of a predicted secondary folding of GAM336539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336539 folded precursor RNA yielding a GAM336539 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336539 RNA, hereby incorporated herein.

GAM336539 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336539 target RNA, herein designated GAM TARGET RNA.

GAM336539 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336539 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336539 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336539 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336539 RNA, herein designated GAM RNA, to target binding sites on GAM336539 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336539 target RNA into GAM336539 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336539 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336539 target genes. The mRNA of each one of this plurality of GAM336539 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336539 RNA, herein designated GAM RNA, and which when bound by GAM336539 RNA causes inhibition of translation of the GAM336539 target mRNA into a corresponding GAM336539 target protein.

The mechanism of the translational inhibition exerted by GAM336539 RNA, herein designated GAM RNA, on one or more GAM336539 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336539 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336539 RNA, herein designated GAM RNA, of GAM336539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336539 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336539 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336539 RNA correlate with, and may be deduced from, the identity of the GAM336539 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336540 5760 AGGATCACTT Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGCCCAGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTGGAGGCT Messenger 336540 (GAM336540) oligonucleotides modulates expression of respective target
GCAGTGAGCT genes whose function and utility is known in the art.

ATGATTGCAC GAM336540 is a novel bioinformatically detectable regulatory, non protein
TACTGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336540 was detected
CAGCCTGGGC is described with additional reference to Figs. 9-15.

AACAGAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATCCT encoded by the human genome.

GAM336540 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336540 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336540 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336540 precursor RNA is designated SEQ ID:5760, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5760 is located from position 24922097 to position 24922182 relative to chromosome 10 on the `+` strand.

GAM336540 precursor RNA folds onto itself, forming GAM336540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336540 precursor RNA, designated SEQ ID NO: 5760, and a schematic representation of a predicted secondary folding of GAM336540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336540 folded precursor RNA yielding a GAM336540 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336540 RNA, hereby incorporated herein. Expression of GAM336540 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336540 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336540 target RNA, herein designated GAM TARGET RNA.

GAM336540 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336540 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336540 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336540 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336540 RNA, herein designated GAM RNA, to target binding sites on GAM336540 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336540 target RNA into GAM336540 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336540 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336540 target genes. The mRNA of each one of this plurality of GAM336540 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336540 RNA, herein designated GAM RNA, and which when bound by GAM336540 RNA causes inhibition of translation of the GAM336540 target mRNA into a corresponding GAM336540 target protein.

The mechanism of the translational inhibition exerted by GAM336540 RNA, herein designated GAM RNA, on one or more GAM336540 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336540 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336540 RNA, herein designated GAM RNA, of GAM336540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336540 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336540 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336540 RNA correlate with, and may be deduced from, the identity of the GAM336540 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336541 6182 CTCTTGAACC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGGAAGTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTTGCAGT Messenger 336541 (GAM336541) oligonucleotides modulates expression of respective target

GAGCTGAGAT genes whose function and utility is known in the art.

AGCAACACTG GAM336541 is a novel bioinformatically detectable regulatory, non protein

CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336541 was detected

TGGGCAACAA is described with additional reference to Figs. 9-15.

GAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336541 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336541 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336541 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336541 precursor RNA is designated SEQ ID:6182, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6182 is located from position 25258227 to position 25258300 relative to chromosome 14 on the `-` strand.

GAM336541 precursor RNA folds onto itself, forming GAM336541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336541 precursor RNA, designated SEQ ID NO: 6182, and a schematic representation of a predicted secondary folding of GAM336541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336541 folded precursor RNA yielding a GAM336541 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336541 RNA, hereby incorporated herein. Expression of GAM336541 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336541 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336541 target RNA, herein designated GAM TARGET RNA.

GAM336541 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336541 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336541 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336541 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336541 RNA, herein designated GAM RNA, to target binding sites on GAM336541 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336541 target RNA into GAM336541 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336541 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336541 target genes. The mRNA of each one of this plurality of GAM336541 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336541 RNA,

herein designated GAM RNA, and which when bound by GAM336541 RNA causes inhibition of translation of the GAM336541 target mRNA into a corresponding GAM336541 target protein.

The mechanism of the translational inhibition exerted by GAM336541 RNA, herein designated GAM RNA, on one or more GAM336541 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336541 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336541 RNA, herein designated GAM RNA, of GAM336541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336541 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336541 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336541 RNA correlate with, and may be deduced from, the identity of the GAM336541 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336545 6652 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGTGGTGAG genes whose function and utility is known in the art.

CCGAGCTTGC GAM336545 is a novel bioinformatically detectable regulatory, non protein

ACACCATTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336545 was detected

ACTCCAGCCT is described with additional reference to Figs. 9-15.

GGGCAACAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGAAACTC encoded by the human genome.

C GAM336545 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336545 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336545 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336545 precursor RNA is designated SEQ ID:6652, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6652 is located from position 25807898 to position 25807988 relative to chromosome 2 on the `+` strand.

GAM336545 precursor RNA folds onto itself, forming GAM336545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336545 precursor RNA, designated SEQ ID NO: 6652, and a schematic representation of a predicted secondary folding of GAM336545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336545 folded precursor RNA yielding a GAM336545 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336545 RNA, hereby incorporated herein. Expression of GAM336545 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336545 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336545 target RNA, herein designated GAM TARGET RNA.

GAM336545 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336545 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336545 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336545 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336545 RNA, herein designated GAM RNA, to target binding sites on GAM336545 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336545 target RNA into GAM336545 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336545 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336545 target genes. The mRNA of each one of this plurality of GAM336545 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336545 RNA, herein designated GAM RNA, and which when bound by GAM336545 RNA causes inhibition of translation of the GAM336545 target mRNA into a corresponding GAM336545 target protein.

The mechanism of the translational inhibition exerted by GAM336545 RNA, herein designated GAM RNA, on one or more GAM336545 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336545 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336545 RNA, herein designated GAM RNA, of GAM336545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336545 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336545 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336545 RNA correlate with, and may be deduced from, the identity of the GAM336545 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336546 5850 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336546 (GAM336546) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336546 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336546 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336546 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336546 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336546 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336546 precursor RNA is designated SEQ ID:5850, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5850 is located from position 25943926 to position 25944007 relative to chromosome 11 on the `+` strand.

GAM336546 precursor RNA folds onto itself, forming GAM336546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336546 precursor RNA, designated SEQ ID NO: 5850, and a schematic representation of a predicted secondary folding of GAM336546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336546 folded precursor RNA yielding a GAM336546 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336546 RNA, hereby incorporated herein.

GAM336546 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336546 target RNA, herein designated GAM TARGET RNA.

GAM336546 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336546 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336546 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336546 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336546 RNA, herein designated GAM RNA, to target binding sites on GAM336546 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336546 target RNA into GAM336546 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336546 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336546 target genes. The mRNA of each one of this plurality of GAM336546 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336546 RNA, herein designated GAM RNA, and which when bound by GAM336546 RNA causes inhibition of translation of the GAM336546 target mRNA into a corresponding GAM336546 target protein.

The mechanism of the translational inhibition exerted by GAM336546 RNA, herein designated GAM RNA, on one or more GAM336546 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336546 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336546 RNA, herein designated GAM RNA, of GAM336546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336546 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336546 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336546 RNA correlate with, and may be deduced from, the identity of the GAM336546 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336548 6980 TATCTCATCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTTTTAATC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGAAGGCAT Messenger 336548 (GAM336548) oligonucleotides modulates expression of respective target

ATATGTATGA genes whose function and utility is known in the art.

CATTATCTGT GAM336548 is a novel bioinformatically detectable regulatory, non protein
CTTTAGGGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336548 was detected
GAGACCCAAC is described with additional reference to Figs. 9-15.

AGAGGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336548 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336548 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336548 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336548 precursor RNA is designated SEQ ID:6980, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6980 is located from position 26121979 to position 26122055 relative to chromosome 12 on the `+` strand.

GAM336548 precursor RNA folds onto itself, forming GAM336548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336548 precursor RNA, designated SEQ ID NO: 6980, and a schematic representation of a predicted secondary folding of GAM336548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336548 folded precursor RNA yielding a GAM336548 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336548 RNA, hereby incorporated herein.

GAM336548 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336548 target RNA, herein designated GAM TARGET RNA.

GAM336548 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336548 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336548 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336548 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336548 RNA, herein designated GAM RNA, to target binding sites on GAM336548 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336548 target RNA into GAM336548 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336548 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336548 target genes. The mRNA of each one of this plurality of GAM336548 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336548 RNA, herein designated GAM RNA, and which when bound by GAM336548 RNA causes inhibition of translation of the GAM336548 target mRNA into a corresponding GAM336548 target protein.

The mechanism of the translational inhibition exerted by GAM336548 RNA, herein designated GAM RNA, on one or more GAM336548 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336548 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336548 RNA, herein designated GAM RNA, of GAM336548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336548 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336548 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336548 RNA correlate with, and may be deduced from, the identity of the GAM336548 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336549 5851 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336549 (GAM336549) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336549 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336549 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336549 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336549 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336549 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336549 precursor RNA is designated SEQ ID:5851, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5851 is located from position 26362757 to position 26362838 relative to chromosome 14 on the `+` strand.

GAM336549 precursor RNA folds onto itself, forming GAM336549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336549 precursor RNA, designated SEQ ID NO: 5851, and a schematic representation of a predicted secondary folding of GAM336549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336549 folded precursor RNA yielding a GAM336549 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336549 RNA, hereby incorporated herein.

GAM336549 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336549 target RNA, herein designated GAM TARGET RNA.

GAM336549 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336549 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336549 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336549 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336549 RNA, herein designated GAM RNA, to target binding sites on GAM336549 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336549 target RNA into GAM336549 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336549 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336549 target genes. The mRNA of each one of this plurality of GAM336549 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336549 RNA, herein designated GAM RNA, and which when bound by GAM336549 RNA causes inhibition of translation of the GAM336549 target mRNA into a corresponding GAM336549 target protein.

The mechanism of the translational inhibition exerted by GAM336549 RNA, herein designated GAM RNA, on one or more GAM336549 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336549 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336549 RNA, herein designated GAM RNA, of GAM336549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336549 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336549 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336549 RNA correlate with, and may be deduced from, the identity of the GAM336549 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336550 5688 ACAGCTCACC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCAAGGCTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCAACTCTGC Messenger 336550 (GAM336550) oligonucleotides modulates expression of respective target
TGACCTTCAG genes whose function and utility is known in the art.

AGTGTCAGAG GAM336550 is a novel bioinformatically detectable regulatory, non protein
CAGTGCCGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336550 was detected
GCCCAGGACA is described with additional reference to Figs. 9-15.

TGGCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336550 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336550 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336550 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336550 precursor RNA is designated SEQ ID:5688, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5688 is located from position 26370649 to position 26370725 relative to chromosome 12 on the `+` strand.

GAM336550 precursor RNA folds onto itself, forming GAM336550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336550 precursor RNA, designated SEQ ID NO: 5688, and a schematic representation of a predicted secondary folding of GAM336550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336550 folded precursor RNA yielding a GAM336550 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336550 RNA, hereby incorporated herein.

GAM336550 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336550 target RNA, herein designated GAM TARGET RNA.

GAM336550 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336550 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336550 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336550 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336550 RNA, herein designated GAM RNA, to target binding sites on GAM336550 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336550 target RNA into GAM336550 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336550 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336550 target genes. The mRNA of each one of this plurality of GAM336550 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336550 RNA, herein designated GAM RNA, and which when bound by GAM336550 RNA causes inhibition of translation of the GAM336550 target mRNA into a corresponding GAM336550 target protein.

The mechanism of the translational inhibition exerted by GAM336550 RNA, herein designated GAM RNA, on one or more GAM336550 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336550 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336550 RNA, herein designated GAM RNA, of GAM336550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336550 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336550 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336550 RNA correlate with, and may be deduced from, the identity of the GAM336550 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTCTTCCCAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336551 was detected
ATCTTTTTAG is described with additional reference to Figs. 9-15.

CATTTGAGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGGCT encoded by the human genome.

GAM336551 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336551 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336551 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336551 precursor RNA is designated SEQ ID:6751, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6751 is located from position 26442598 to position 26442683 relative to chromosome 7 on the `+` strand.

GAM336551 precursor RNA folds onto itself, forming GAM336551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336551 precursor RNA, designated SEQ ID NO: 6751, and a schematic representation of a predicted secondary folding of GAM336551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336551 folded precursor RNA yielding a GAM336551 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336551 RNA, hereby incorporated herein.

GAM336551 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336551 target RNA, herein designated GAM TARGET RNA.

GAM336551 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336551 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336551 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336551 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336551 RNA, herein designated GAM RNA, to target binding sites on GAM336551 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336551 target RNA into GAM336551 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336551 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336551 target genes. The mRNA of each one of this plurality of GAM336551 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336551 RNA, herein designated GAM RNA, and which when bound by GAM336551 RNA causes inhibition of translation of the GAM336551 target mRNA into a corresponding GAM336551 target protein.

The mechanism of the translational inhibition exerted by GAM336551 RNA, herein designated GAM RNA, on one or more GAM336551 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336551 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336551 RNA, herein designated GAM RNA, of GAM336551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336551 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336551 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336551 RNA correlate with, and may be deduced from, the identity of the GAM336551 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAGATGACTG is described with additional reference to Figs. 9-15.

TATCACTGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTACAGT encoded by the human genome.

GAM336552 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336552 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336552 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336552 precursor RNA is designated SEQ ID:5708, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5708 is located from position 26468156 to position 26468242 relative to chromosome 9 on the `+` strand.

GAM336552 precursor RNA folds onto itself, forming GAM336552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336552 precursor RNA, designated SEQ ID NO: 5708, and a schematic representation of a predicted secondary folding of GAM336552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336552 folded precursor RNA yielding a GAM336552 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336552 RNA, hereby incorporated herein.

GAM336552 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336552 target RNA, herein designated GAM TARGET RNA.

GAM336552 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336552 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336552 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336552 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336552 RNA, herein designated GAM RNA, to target binding sites on GAM336552 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336552 target RNA into GAM336552 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336552 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336552 target genes. The mRNA of each one of this plurality of GAM336552 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336552 RNA, herein designated GAM RNA, and which when bound by GAM336552 RNA causes inhibition of translation of the GAM336552 target mRNA into a corresponding GAM336552 target protein.

The mechanism of the translational inhibition exerted by GAM336552 RNA, herein designated GAM RNA, on one or more GAM336552 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336552 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336552 RNA, herein designated GAM RNA, of GAM336552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336552 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336552 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336552 RNA correlate with, and may be deduced from, the identity of the GAM336552 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336553 6986 TATTCCAGAT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGGTTTACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336553 was detected

TCTTCAGTGG is described with additional reference to Figs. 9-15.

AAGTGTTCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTTGCAAAT encoded by the human genome.

ACTAGTTACT GAM336553 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGAATA GAM336553 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336553 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336553 precursor RNA is designated SEQ

ID:6986, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6986 is located from position 26541313 to position 26541418 relative to chromosome X on the `-` strand.

GAM336553 precursor RNA folds onto itself, forming GAM336553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336553 precursor RNA, designated SEQ ID NO: 6986, and a schematic representation of a predicted secondary folding of GAM336553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336553 folded precursor RNA yielding a GAM336553 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336553 RNA, hereby incorporated herein.

GAM336553 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336553 target RNA, herein designated GAM TARGET RNA.

GAM336553 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336553 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336553 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336553 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336553 RNA, herein designated GAM RNA, to target binding sites on GAM336553 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336553 target RNA into GAM336553 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336553 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336553 target genes. The mRNA of each one of this plurality of GAM336553 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336553 RNA, herein designated GAM RNA, and which when bound by GAM336553 RNA causes inhibition of translation of the GAM336553 target mRNA into a corresponding GAM336553 target protein.

The mechanism of the translational inhibition exerted by GAM336553 RNA, herein designated GAM RNA, on one or more GAM336553 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336553 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336553 RNA, herein designated GAM RNA, of GAM336553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336553 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336553 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336553 RNA correlate with, and may be deduced from, the identity of the GAM336553 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336556 6052 CCAGCTGCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCTTCTACC detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACCCCATC Messenger 336556 (GAM336556) oligonucleotides modulates expression of respective target

TCATAGAACT genes whose function and utility is known in the art.

CACAACAACC GAM336556 is a novel bioinformatically detectable regulatory, non protein

TTGTTGGGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336556 was detected

AAAAGGAGGG is described with additional reference to Figs. 9-15.

GATACAGGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTTAAAGAGG encoded by the human genome.

GGGAAATAAC GAM336556 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CATATAGCTG GAM336556 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

G GAM336556 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336556 precursor RNA is designated SEQ ID:6052, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6052 is located from position 26895579 to position 26895689 relative to chromosome 17 on the `+` strand.

GAM336556 precursor RNA folds onto itself, forming GAM336556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336556 precursor RNA, designated SEQ ID NO: 6052, and a schematic representation of a predicted secondary folding of GAM336556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336556 folded precursor RNA yielding a GAM336556 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336556 RNA, hereby incorporated herein.

GAM336556 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336556 target RNA, herein designated GAM TARGET RNA.

GAM336556 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336556 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336556 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336556 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336556 RNA, herein designated GAM RNA, to target binding sites on GAM336556 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336556 target RNA into GAM336556 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336556 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336556 target genes. The mRNA of each one of this plurality of GAM336556 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336556 RNA, herein designated GAM RNA, and which when bound by GAM336556 RNA causes inhibition of translation of the GAM336556 target mRNA into a corresponding GAM336556 target protein.

The mechanism of the translational inhibition exerted by GAM336556 RNA, herein designated GAM RNA, on one or more GAM336556 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336556 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336556 RNA, herein designated GAM RNA, of GAM336556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336556 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336556 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336556 RNA correlate with, and may be deduced from, the identity of the GAM336556 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336557 5852 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336557 (GAM336557) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336557 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336557 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336557 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336557 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336557 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336557 precursor RNA is designated SEQ ID:5852, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5852 is located from position 26976985 to position 26977066 relative to chromosome 18 on the `+` strand.

GAM336557 precursor RNA folds onto itself, forming GAM336557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336557 precursor RNA, designated SEQ ID NO: 5852, and a schematic representation of a predicted secondary folding of GAM336557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336557 folded precursor RNA yielding a GAM336557 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336557 RNA, hereby incorporated herein.

GAM336557 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336557 target RNA, herein designated GAM TARGET RNA.

GAM336557 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336557 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336557 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336557 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336557 RNA, herein designated GAM RNA, to target binding sites on GAM336557 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336557 target RNA into GAM336557 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336557 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336557 target genes. The mRNA of each one of this plurality of GAM336557 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336557 RNA, herein designated GAM RNA, and which when bound by GAM336557 RNA causes inhibition of translation of the GAM336557 target mRNA into a corresponding GAM336557 target protein.

The mechanism of the translational inhibition exerted by GAM336557 RNA, herein designated GAM RNA, on one or more GAM336557 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336557 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336557 RNA, herein designated GAM RNA, of GAM336557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336557 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336557 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336557 RNA correlate with, and may be deduced from, the identity of the GAM336557 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336558 6635 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGTGGAGG Messenger 336558 (GAM336558) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGGTCAC GAM336558 is a novel bioinformatically detectable regulatory, non protein
ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336558 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336558 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336558 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336558 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336558 precursor RNA is designated SEQ ID:6635, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6635 is located from position 26978328 to position 26978415 relative to chromosome 6 on the `+` strand.

GAM336558 precursor RNA folds onto itself, forming GAM336558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336558 precursor RNA, designated SEQ ID NO: 6635, and a schematic representation of a predicted secondary folding of GAM336558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336558 folded precursor RNA yielding a GAM336558 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336558 RNA, hereby incorporated herein. Expression of GAM336558 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336558 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336558 target RNA, herein designated GAM TARGET RNA.

GAM336558 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336558 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336558 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336558 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336558 RNA, herein designated GAM RNA, to target binding sites on GAM336558 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336558 target RNA into GAM336558 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336558 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336558 target genes. The mRNA of each one of this plurality of GAM336558 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336558 RNA, herein designated GAM RNA, and which when bound by GAM336558 RNA causes inhibition of translation of the GAM336558 target mRNA into a corresponding GAM336558 target protein.

The mechanism of the translational inhibition exerted by GAM336558 RNA, herein designated GAM RNA, on one or more GAM336558 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336558 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336558 RNA, herein designated GAM RNA, of GAM336558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336559 (GAM336559) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336559 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336559 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336559 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336559 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336559 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336559 precursor RNA is designated SEQ ID:5695, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5695 is located from position 27187756 to position 27187828 relative to chromosome Y on the `+` strand.

GAM336559 precursor RNA folds onto itself, forming GAM336559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336559 precursor RNA, designated SEQ ID NO: 5695, and a schematic representation of a predicted secondary folding of GAM336559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336559 folded precursor RNA yielding a GAM336559 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336559 RNA, hereby incorporated herein.

GAM336559 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336559 target RNA, herein designated GAM TARGET RNA.

GAM336559 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336559 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336559 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336559 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336559 RNA, herein designated GAM RNA, to target binding sites on GAM336559 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336559 target RNA into GAM336559 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336559 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336559 target genes. The mRNA of each one of this plurality of GAM336559 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336559 RNA, herein designated GAM RNA, and which when bound by GAM336559 RNA causes inhibition of translation of the GAM336559 target mRNA into a corresponding GAM336559 target protein.

The mechanism of the translational inhibition exerted by GAM336559 RNA, herein designated GAM RNA, on one or more GAM336559 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336559 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336559 RNA, herein designated GAM RNA, of GAM336559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336559 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336559 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336559 RNA correlate with, and may be deduced from, the identity of the GAM336559 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336560 7289 TTCACCCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGCCAGGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTCTTGAAC Messenger 336560 (GAM336560) oligonucleotides modulates expression of respective target

TCCTGACTTT genes whose function and utility is known in the art.

TGCCTTGGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336560 was detected

ACCCAAAGTG is described with additional reference to Figs. 9-15.

CTGGTATTAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGTGTGAGC encoded by the human genome.

CACCGCGCCT GAM336560 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGCCGGTGAA GAM336560 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336560 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336560 precursor RNA is designated SEQ ID:7289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7289 is located from position 27457170 to position 27457279 relative to chromosome 8 on the `+` strand.

GAM336560 precursor RNA folds onto itself, forming GAM336560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336560 precursor RNA, designated SEQ ID NO: 7289, and a schematic representation of a predicted secondary folding of GAM336560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336560 folded precursor RNA yielding a GAM336560 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336560 RNA, hereby incorporated herein.

GAM336560 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336560 target RNA, herein designated GAM TARGET RNA.

GAM336560 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336560 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336560 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336560 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336560 RNA, herein designated GAM RNA, to target binding sites on GAM336560 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336560 target RNA into GAM336560 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336560 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336560 target genes. The mRNA of each one of this plurality of GAM336560 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336560 RNA, herein designated GAM RNA, and which when bound by GAM336560 RNA causes inhibition of translation of the GAM336560 target mRNA into a corresponding GAM336560 target protein.

The mechanism of the translational inhibition exerted by GAM336560 RNA, herein designated GAM RNA, on one or more GAM336560 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336560 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336560 RNA, herein designated GAM RNA, of GAM336560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336560 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336560 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336560 RNA correlate with, and may be deduced from, the identity of the GAM336560 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336561 6537 GCTCTGTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGAATCGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AAATATGGGG Messenger 336561 (GAM336561) oligonucleotides modulates expression of respective target

CTCTTTTCTG genes whose function and utility is known in the art.

TCTTTGCGAT GAM336561 is a novel bioinformatically detectable regulatory, non protein

TTTGGCTATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336561 was detected

AATTTGTAGC is described with additional reference to Figs. 9-15.

AGAACACTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTCCAGTTTC encoded by the human genome.

TTCATTATCT GAM336561 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTTTACTGAG GAM336561 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

C GAM336561 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336561 precursor RNA is designated SEQ ID:6537, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6537 is located from position 27480931 to position 27481041 relative to chromosome 11 on the `+` strand.

GAM336561 precursor RNA folds onto itself, forming GAM336561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336561 precursor RNA, designated SEQ ID NO: 6537, and a schematic representation of a predicted secondary folding of GAM336561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336561 folded precursor RNA yielding a GAM336561 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336561 RNA, hereby incorporated herein.

GAM336561 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336561 target RNA, herein designated GAM TARGET RNA.

GAM336561 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336561 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336561 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336561 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336561 RNA, herein designated GAM RNA, to target binding sites on GAM336561 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336561 target RNA into GAM336561 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336561 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336561 target genes. The mRNA of each one of this

plurality of GAM336561 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336561 RNA, herein designated GAM RNA, and which when bound by GAM336561 RNA causes inhibition of translation of the GAM336561 target mRNA into a corresponding GAM336561 target protein.

The mechanism of the translational inhibition exerted by GAM336561 RNA, herein designated GAM RNA, on one or more GAM336561 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336561 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336561 RNA, herein designated GAM RNA, of GAM336561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336561 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336561 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336561 RNA correlate with, and may be deduced from, the identity of the GAM336561 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336563 5759 AGGATCACTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TATGACTGTG GAM336563 is a novel bioinformatically detectable regulatory, non protein
TCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336563 was detected
TCAGCCTGGG is described with additional reference to Figs. 9-15.

CAATGGAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGATCCT encoded by the human genome.

GAM336563 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336563 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336563 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336563 precursor RNA is designated SEQ ID:5759, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5759 is located from position 27711245 to position 27711331 relative to chromosome 12 on the `+` strand.

GAM336563 precursor RNA folds onto itself, forming GAM336563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336563 precursor RNA, designated SEQ ID NO: 5759, and a schematic representation of a predicted secondary folding of GAM336563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336563 folded precursor RNA yielding a GAM336563 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336563 RNA, hereby incorporated herein.

GAM336563 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336563 target RNA, herein designated GAM TARGET RNA.

GAM336563 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336563 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336563 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336563 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336563 RNA, herein designated GAM RNA, to target binding sites on GAM336563 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336563 target RNA into GAM336563 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336563 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336563 target genes. The mRNA of each one of this plurality of GAM336563 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336563 RNA, herein designated GAM RNA, and which when bound by GAM336563 RNA causes inhibition of translation of the GAM336563 target mRNA into a corresponding GAM336563 target protein.

The mechanism of the translational inhibition exerted by GAM336563 RNA, herein designated GAM RNA, on one or more GAM336563 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336563 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336563 RNA, herein designated GAM RNA, of GAM336563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336563 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336563 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336563 RNA correlate with, and may be deduced from, the identity of the GAM336563 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGGTGGAGC Messenger 336564 (GAM336564) oligonucleotides modulates expression of respective target

TTACAGTGAG genes whose function and utility is known in the art.

CCACCGAGAT GAM336564 is a novel bioinformatically detectable regulatory, non protein

TGTGTCATTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336564 was detected

CACTCCAGCC is described with additional reference to Figs. 9-15.

TGGGCAACAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGCAAATCT encoded by the human genome.

CC GAM336564 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336564 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336564 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336564 precursor RNA is designated SEQ ID:6601, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6601 is located from position 27748402 to position 27748493 relative to chromosome 6 on the `+` strand.

GAM336564 precursor RNA folds onto itself, forming GAM336564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336564 precursor RNA, designated SEQ ID NO: 6601, and a schematic representation of a predicted secondary folding of GAM336564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336564 folded precursor RNA yielding a GAM336564 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336564 RNA, hereby incorporated herein. Expression of GAM336564 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336564 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336564 target RNA, herein designated GAM TARGET RNA.

GAM336564 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336564 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336564 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336564 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336564 RNA, herein designated GAM RNA, to target binding sites on GAM336564 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336564 target RNA into GAM336564 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336564 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336564 target genes. The mRNA of each one of this plurality of GAM336564 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336564 RNA, herein designated GAM RNA, and which when bound by GAM336564 RNA causes inhibition of translation of the GAM336564 target mRNA into a corresponding GAM336564 target protein.

The mechanism of the translational inhibition exerted by GAM336564 RNA, herein designated GAM RNA, on one or more GAM336564 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336564 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336564 RNA, herein designated GAM RNA, of GAM336564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336564 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336564 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336564 RNA correlate with, and may be deduced from, the identity of the GAM336564 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336565 5997 CACCTGTCAT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTAGTGAGC GAM336565 is a novel bioinformatically detectable regulatory, non protein
TGTGATTCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336565 was detected
CCACTGCATT is described with additional reference to Figs. 9-15.

CCAGCCTGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGACAGAGTG encoded by the human genome.

GAM336565 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336565 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336565 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336565 precursor RNA is designated SEQ ID:5997, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5997 is located from position 27947083 to position 27947172 relative to chromosome 10 on the `+` strand.

GAM336565 precursor RNA folds onto itself, forming GAM336565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336565 precursor RNA, designated SEQ ID NO: 5997, and a schematic representation of a predicted secondary folding of GAM336565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336565 folded precursor RNA yielding a GAM336565 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336565 RNA, hereby incorporated herein.

GAM336565 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336565 target RNA, herein designated GAM TARGET RNA.

GAM336565 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336565 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336565 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336565 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336565 RNA, herein designated GAM RNA, to target binding sites on GAM336565 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336565 target RNA into GAM336565 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336565 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336565 target genes. The mRNA of each one of this plurality of GAM336565 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336565 RNA, herein designated GAM RNA, and which when bound by GAM336565 RNA causes inhibition of translation of the GAM336565 target mRNA into a corresponding GAM336565 target protein.

The mechanism of the translational inhibition exerted by GAM336565 RNA, herein designated GAM RNA, on one or more GAM336565 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336565 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336565 RNA, herein designated GAM RNA, of GAM336565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336565 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336565 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336565

RNA correlate with, and may be deduced from, the identity of the GAM336565 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACCAATCCTT encoded by the human genome.

GATTAGAAGC GAM336567 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TTGTA GAM336567 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336567 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336567 precursor RNA is designated SEQ ID:6966, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6966 is located from position 28064331 to position 28064435 relative to chromosome 17 on the `+` strand.

GAM336567 precursor RNA folds onto itself, forming GAM336567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336567 precursor RNA, designated SEQ ID NO: 6966, and a schematic representation of a predicted secondary folding of GAM336567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336567 folded precursor RNA yielding a GAM336567 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336567 RNA, hereby incorporated herein.

GAM336567 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336567 target RNA, herein designated GAM TARGET RNA.

GAM336567 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336567 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336567 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336567 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336567 RNA, herein designated GAM RNA, to target binding sites on GAM336567 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336567 target RNA into GAM336567 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336567 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336567 target genes. The mRNA of each one of this plurality of GAM336567 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336567 RNA, herein designated GAM RNA, and which when bound by GAM336567 RNA causes inhibition of translation of the GAM336567 target mRNA into a corresponding GAM336567 target protein.

The mechanism of the translational inhibition exerted by GAM336567 RNA, herein designated GAM RNA, on one or more GAM336567 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336567 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336567 RNA, herein designated GAM RNA, of GAM336567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336567 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336567 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336567 RNA correlate with, and may be deduced from, the identity of the GAM336567 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336568 6270 CTTTAGTTTT Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGGAAGTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCTTGGCTG Messenger 336568 (GAM336568) oligonucleotides modulates expression of respective target
GCCCCTAGAT genes whose function and utility is known in the art.

AGCTTTAGGA GAM336568 is a novel bioinformatically detectable regulatory, non protein
TGGGAGCTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336568 was detected
TCACCAGAAA is described with additional reference to Figs. 9-15.

CACCAATCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGATTAGAAG encoded by the human genome.

GAM336568 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336568 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336568 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336568 precursor RNA is designated SEQ ID:6270, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6270 is located from position 28064340 to position 28064429 relative to chromosome 17 on the `+` strand.

GAM336568 precursor RNA folds onto itself, forming GAM336568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336568 precursor RNA, designated SEQ ID NO: 6270, and a schematic representation of a predicted secondary folding of GAM336568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336568 folded precursor RNA yielding a GAM336568 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336568 RNA, hereby incorporated herein.

GAM336568 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336568 target RNA, herein designated GAM TARGET RNA.

GAM336568 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336568 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336568 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336568 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336568 RNA, herein designated GAM RNA, to target binding sites on GAM336568 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336568 target RNA into GAM336568 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336568 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336568 target genes. The mRNA of each one of this plurality of GAM336568 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336568 RNA, herein designated GAM RNA, and which when bound by GAM336568 RNA causes inhibition of translation of the GAM336568 target mRNA into a corresponding GAM336568 target protein.

The mechanism of the translational inhibition exerted by GAM336568 RNA, herein designated GAM RNA, on one or more GAM336568 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336568 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336568 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336568 RNA, herein designated GAM RNA, of GAM336568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336568 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336568 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336568 RNA correlate with, and may be deduced from, the identity of the GAM336568 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336569 7342 TTTAGTTTTA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGAAGTGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTTGGCTGG Messenger 336569 (GAM336569) oligonucleotides modulates expression of respective target

CCCCTAGATA genes whose function and utility is known in the art.

GCTTTAGGAT GAM336569 is a novel bioinformatically detectable regulatory, non protein

GGGAGCTAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336569 was detected

CACCAGAAAC is described with additional reference to Figs. 9-15.

ACCAATCCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GATTAGA encoded by the human genome.

GAM336569 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336569 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336569 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336569 precursor RNA is designated SEQ ID:7342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7342 is located from position 28064341 to position 28064427 relative to chromosome 17 on the `+` strand.

GAM336569 precursor RNA folds onto itself, forming GAM336569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336569 precursor RNA, designated SEQ ID NO: 7342, and a schematic representation of a predicted secondary folding of GAM336569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336569 folded precursor RNA yielding a GAM336569 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336569 RNA, hereby incorporated herein.

GAM336569 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336569 target RNA, herein designated GAM TARGET RNA.

GAM336569 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336569 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336569 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336569 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336569 RNA, herein designated GAM RNA, to target binding sites on GAM336569 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336569 target RNA into GAM336569 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336569 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336569 target genes. The mRNA of each one of this plurality of GAM336569 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336569 RNA, herein designated GAM RNA, and which when bound by GAM336569 RNA causes inhibition of translation of the GAM336569 target mRNA into a corresponding GAM336569 target protein.

The mechanism of the translational inhibition exerted by GAM336569 RNA, herein

designated GAM RNA, on one or more GAM336569 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336569 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336569 RNA, herein designated GAM RNA, of GAM336569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336569 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336569 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336569 RNA correlate with, and may be deduced from, the identity of the GAM336569 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336570 6577 GGAACAGTAC Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTCACGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCTGGAGAG Messenger 336570 (GAM336570) oligonucleotides modulates expression of respective target

GAGCGGTCAC genes whose function and utility is known in the art.

TGGTTGCTGA GAM336570 is a novel bioinformatically detectable regulatory, non protein

GTGAATTAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336570 was detected

CGAATGTTTG is described with additional reference to Figs. 9-15.

CTGCTTTTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTGCAACAG encoded by the human genome.

TTCATTATTC GAM336570 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM336570 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336570 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336570 precursor RNA is designated SEQ ID:6577, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6577 is located from position 28404293 to position 28404393 relative to chromosome 22 on the `+` strand.

GAM336570 precursor RNA folds onto itself, forming GAM336570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336570 precursor RNA, designated SEQ ID NO: 6577, and a schematic representation of a predicted secondary folding of GAM336570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336570 folded precursor RNA yielding a GAM336570 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336570 RNA, hereby incorporated herein.

GAM336570 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336570 target RNA, herein designated GAM TARGET RNA.

GAM336570 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336570 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336570 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336570 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336570 RNA, herein designated GAM RNA, to target binding sites on GAM336570 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336570 target RNA into GAM336570 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336570 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336570 target genes. The mRNA of each one of this plurality of GAM336570 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336570 RNA, herein designated GAM RNA, and which when bound by GAM336570 RNA causes inhibition of translation of the GAM336570 target mRNA into a corresponding GAM336570 target protein.

The mechanism of the translational inhibition exerted by GAM336570 RNA, herein designated GAM RNA, on one or more GAM336570 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336570 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336570 RNA, herein designated GAM RNA, of GAM336570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336570 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336570 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336570 RNA correlate with, and may be deduced from, the identity of the GAM336570 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336571 6556 GCTTCATCAT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTGGTTCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCAGTGTTTC Messenger 336571 (GAM336571) oligonucleotides modulates expression of respective target

TTCTCTATCA genes whose function and utility is known in the art.

GGCCTGGTGG GAM336571 is a novel bioinformatically detectable regulatory, non protein

CTGTTGTTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336571 was detected

GGGCTCCCCA is described with additional reference to Figs. 9-15.

AGGCGAGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGGCCCTGGA encoded by the human genome.

CAAGTGGGTT GAM336571 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGAAGACACG GAM336571 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GTGACCAGAG GAM336571 precursor RNA does not encode a protein. A nucleotide sequence identical or

AAGAGGGAAG highly similar to the nucleotide sequence of GAM336571 precursor RNA is designated SEQ

C ID:6556, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6556 is located from position 28441207 to position 28441337 relative to chromosome 15 on the `-` strand.

GAM336571 precursor RNA folds onto itself, forming GAM336571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336571 precursor RNA, designated SEQ ID NO: 6556, and a schematic representation of a predicted secondary folding of GAM336571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336571 folded precursor RNA yielding a GAM336571 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336571 RNA, hereby incorporated herein.

GAM336571 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336571 target RNA, herein designated GAM TARGET RNA.

GAM336571 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336571 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336571 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336571 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336571 RNA, herein designated GAM RNA, to target binding sites on GAM336571 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336571 target RNA into GAM336571 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336571 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336571 target genes. The mRNA of each one of this plurality of GAM336571 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336571 RNA, herein designated GAM RNA, and which when bound by GAM336571 RNA causes inhibition of translation of the GAM336571 target mRNA into a corresponding GAM336571 target protein.

The mechanism of the translational inhibition exerted by GAM336571 RNA, herein designated GAM RNA, on one or more GAM336571 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336571 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336571 RNA, herein designated GAM RNA, of GAM336571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336571 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336571 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336571 RNA correlate with, and may be deduced from, the identity of the GAM336571 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336572 6465 GAGTGACCCC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATCTCTACAA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAAGTTTTTT Messenger 336572 (GAM336572) oligonucleotides modulates expression of respective target

TAAATTAGCT genes whose function and utility is known in the art.

AGGCATGGTG GAM336572 is a novel bioinformatically detectable regulatory, non protein
GTATACACTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336572 was detected
GTAGTCCTAG is described with additional reference to Figs. 9-15.

CTACTTAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCTGAGGCA encoded by the human genome.

GGAGGGTCAC GAM336572 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TT GAM336572 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336572 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336572 precursor RNA is designated SEQ ID:6465, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6465 is located from position 28604728 to position 28604829 relative to chromosome 8 on the `-` strand.

GAM336572 precursor RNA folds onto itself, forming GAM336572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336572 precursor RNA, designated SEQ ID NO: 6465, and a schematic representation of a predicted secondary folding of GAM336572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336572 folded precursor RNA yielding a GAM336572 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336572 RNA, hereby incorporated herein.

GAM336572 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336572 target RNA, herein designated GAM TARGET RNA.

GAM336572 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336572 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336572 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336572 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336572 RNA, herein designated GAM RNA, to target binding sites on GAM336572 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336572 target RNA into GAM336572 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336572 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336572 target genes. The mRNA of each one of this plurality of GAM336572 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336572 RNA, herein designated GAM RNA, and which when bound by GAM336572 RNA causes inhibition of translation of the GAM336572 target mRNA into a corresponding GAM336572 target protein.

The mechanism of the translational inhibition exerted by GAM336572 RNA, herein designated GAM RNA, on one or more GAM336572 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336572 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336572 RNA, herein designated GAM RNA, of GAM336572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336572 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336572 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336572 RNA correlate with, and may be deduced from, the identity of the GAM336572 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336573 6678 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAA detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 336573 (GAM336573) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCACGATTGT GAM336573 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336573 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GTGACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336573 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336573 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336573 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336573 precursor RNA is designated SEQ ID:6678, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6678 is located from position 28680032 to position 28680119 relative to chromosome 16 on the `+` strand.

GAM336573 precursor RNA folds onto itself, forming GAM336573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336573 precursor RNA, designated SEQ ID NO: 6678, and a schematic representation of a predicted secondary folding of GAM336573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336573 folded precursor RNA yielding a GAM336573 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336573 RNA, hereby incorporated herein.

GAM336573 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336573 target RNA, herein designated GAM TARGET RNA.

GAM336573 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336573 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336573 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336573 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336573 RNA, herein designated GAM RNA, to target binding sites on GAM336573 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336573 target RNA into GAM336573 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336573 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336573 target genes. The mRNA of each one of this plurality of GAM336573 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336573 RNA, herein designated GAM RNA, and which when bound by GAM336573 RNA causes inhibition of translation of the GAM336573 target mRNA into a corresponding GAM336573 target protein.

The mechanism of the translational inhibition exerted by GAM336573 RNA, herein designated GAM RNA, on one or more GAM336573 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336573 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336573 RNA, herein designated GAM RNA, of GAM336573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336573 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336573 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336573 RNA correlate with, and may be deduced from, the identity of the GAM336573 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336574 7308 TTCTGTGATG Fig. 8 further provides a conceptual description of another novel bioinformatically
GGTGTACGAC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGATTATTTT Messenger 336574 (GAM336574) oligonucleotides modulates expression of respective target
GTGACTGCAG genes whose function and utility is known in the art.

TCTGTTCAAA GAM336574 is a novel bioinformatically detectable regulatory, non protein
TCACATCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336574 was detected
AAGCAGCGCT is described with additional reference to Figs. 9-15.

GAGATGATTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTTGGTGCAT encoded by the human genome.

TAAAAGGTTT GAM336574 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGCATCATGG GAM336574 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
AA GAM336574 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336574 precursor RNA is designated SEQ ID:7308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7308 is located from position 28740486 to position 28740597 relative to chromosome 8 on the `+` strand.

GAM336574 precursor RNA folds onto itself, forming GAM336574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336574 precursor RNA, designated SEQ ID NO: 7308, and a schematic representation of a predicted secondary folding of GAM336574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336574 folded precursor

RNA yielding a GAM336574 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336574 RNA, hereby incorporated herein.

GAM336574 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336574 target RNA, herein designated GAM TARGET RNA.

GAM336574 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336574 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336574 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336574 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336574 RNA, herein designated GAM RNA, to target binding sites on GAM336574 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336574 target RNA into GAM336574 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336574 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336574 target genes. The mRNA of each one of this plurality of GAM336574 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336574 RNA, herein designated GAM RNA, and which when bound by GAM336574 RNA causes inhibition of translation of the GAM336574 target mRNA into a corresponding GAM336574 target protein.

The mechanism of the translational inhibition exerted by GAM336574 RNA, herein designated GAM RNA, on one or more GAM336574 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336574 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336574 RNA, herein designated GAM RNA, of GAM336574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336574 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336574 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336574 RNA correlate with, and may be deduced from, the identity of the GAM336574 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336575 6679 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGG Messenger 336575 (GAM336575) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCACGATTGT GAM336575 is a novel bioinformatically detectable regulatory, non protein

GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336575 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GTGACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM336575 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336575 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336575 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336575 precursor RNA is designated SEQ ID:6679, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6679 is located from position 28794191 to position 28794278 relative to chromosome 16 on the `+` strand.

GAM336575 precursor RNA folds onto itself, forming GAM336575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336575 precursor RNA, designated SEQ ID NO: 6679, and a schematic representation of a predicted secondary folding of GAM336575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336575 folded precursor RNA yielding a GAM336575 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336575 RNA, hereby incorporated herein.

GAM336575 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336575 target RNA, herein designated GAM TARGET RNA.

GAM336575 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336575 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336575 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336575 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336575 RNA, herein designated GAM RNA, to target binding sites on GAM336575 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336575 target RNA into GAM336575 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336575 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336575 target genes. The mRNA of each one of this plurality of GAM336575 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336575 RNA, herein designated GAM RNA, and which when bound by GAM336575 RNA causes inhibition of translation of the GAM336575 target mRNA into a corresponding GAM336575 target protein.

The mechanism of the translational inhibition exerted by GAM336575 RNA, herein designated GAM RNA, on one or more GAM336575 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336575 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336575 RNA, herein designated GAM RNA, of GAM336575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336575 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336575 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336575 RNA correlate with, and may be deduced from, the identity of the GAM336575 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336578 7166 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATTGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACTTGAAAG Messenger 336578 (GAM336578) oligonucleotides modulates expression of respective target

GCAGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336578 is a novel bioinformatically detectable regulatory, non protein

AAATTGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336578 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGCAAGA encoded by the human genome.

CTCCATCTCA GAM336578 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336578 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336578 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336578 precursor RNA is designated SEQ ID:7166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7166 is located from position 28958697 to position 28958796 relative to chromosome 17 on the `-` strand.

GAM336578 precursor RNA folds onto itself, forming GAM336578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336578 precursor RNA, designated SEQ ID NO: 7166, and a schematic representation of a predicted secondary folding of GAM336578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336578 folded precursor RNA yielding a GAM336578 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336578 RNA, hereby incorporated herein.

GAM336578 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336578 target RNA, herein designated GAM TARGET RNA.

GAM336578 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336578 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336578 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336578 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336578 RNA, herein designated GAM RNA, to target binding sites on GAM336578 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336578 target RNA into GAM336578 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336578 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336578 target genes. The mRNA of each one of this

plurality of GAM336578 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336578 RNA, herein designated GAM RNA, and which when bound by GAM336578 RNA causes inhibition of translation of the GAM336578 target mRNA into a corresponding GAM336578 target protein.

The mechanism of the translational inhibition exerted by GAM336578 RNA, herein designated GAM RNA, on one or more GAM336578 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336578 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336578 RNA, herein designated GAM RNA, of GAM336578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336578 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336578 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336578 RNA correlate with, and may be deduced from, the identity of the GAM336578 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336579 6427 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACTTGAAAGG Messenger 336579 (GAM336579) oligonucleotides modulates expression of respective target
CAGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCCGA GAM336579 is a novel bioinformatically detectable regulatory, non protein
AATTGCACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336579 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGCGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAGCAAGAC encoded by the human genome.

TCCATCTC GAM336579 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336579 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336579 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336579 precursor RNA is designated SEQ ID:6427, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6427 is located from position 28958698 to position 28958795 relative to chromosome 17 on the `-` strand.

GAM336579 precursor RNA folds onto itself, forming GAM336579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336579 precursor RNA, designated SEQ ID NO: 6427, and a schematic representation of a predicted secondary folding of GAM336579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336579 folded precursor RNA yielding a GAM336579 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336579 RNA, hereby incorporated herein.

GAM336579 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336579 target RNA, herein designated GAM TARGET RNA.

GAM336579 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336579 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336579 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336579 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336579 RNA, herein designated GAM RNA, to target binding sites on GAM336579 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336579 target RNA into GAM336579 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336579 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336579 target genes. The mRNA of each one of this plurality of GAM336579 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336579 RNA, herein designated GAM RNA, and which when bound by GAM336579 RNA causes inhibition of translation of the GAM336579 target mRNA into a corresponding GAM336579 target protein.

The mechanism of the translational inhibition exerted by GAM336579 RNA, herein designated GAM RNA, on one or more GAM336579 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336579 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336579 RNA, herein designated GAM RNA, of GAM336579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336579 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336579 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336579 RNA correlate with, and may be deduced from, the identity of the GAM336579 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCTGGGTCAT GAM336580 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336580 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGACTCC encoded by the human genome.

GAM336580 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336580 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336580 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336580 precursor RNA is designated SEQ ID:6621, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6621 is located from position 28986610 to position 28986698 relative to chromosome 10 on the `+` strand.

GAM336580 precursor RNA folds onto itself, forming GAM336580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336580 precursor RNA, designated SEQ ID NO: 6621, and a schematic representation of a predicted secondary folding of GAM336580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336580 folded precursor RNA yielding a GAM336580 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336580 RNA, hereby incorporated herein. Expression of GAM336580 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336580 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336580 target RNA, herein designated GAM TARGET RNA.

GAM336580 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336580 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336580 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336580 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336580 RNA, herein designated GAM RNA, to target binding sites on GAM336580 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336580 target RNA into GAM336580 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336580 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336580 target genes. The mRNA of each one of this plurality of GAM336580 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336580 RNA, herein designated GAM RNA, and which when bound by GAM336580 RNA causes inhibition of translation of the GAM336580 target mRNA into a corresponding GAM336580 target protein.

The mechanism of the translational inhibition exerted by GAM336580 RNA, herein designated GAM RNA, on one or more GAM336580 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336580 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336580 RNA, herein designated GAM RNA, of GAM336580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336580 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336580 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336580 RNA correlate with, and may be deduced from, the identity of the GAM336580 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTTCTCCTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336581 was detected
CACTCACCCT is described with additional reference to Figs. 9-15.

ATAGTACCGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATAGC encoded by the human genome.

GAM336581 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336581 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336581 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336581 precursor RNA is designated SEQ ID:6551, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6551 is located from position 29024288 to position 29024372 relative to chromosome 8 on the `-` strand.

GAM336581 precursor RNA folds onto itself, forming GAM336581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336581 precursor RNA, designated SEQ ID NO: 6551, and a schematic representation of a predicted secondary folding of GAM336581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336581 folded precursor RNA yielding a GAM336581 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336581 RNA, hereby incorporated herein.

GAM336581 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336581 target RNA, herein designated GAM TARGET RNA.

GAM336581 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336581 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336581 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336581 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336581 RNA, herein designated GAM RNA, to target binding sites on GAM336581 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336581 target RNA into GAM336581 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336581 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336581 target genes. The mRNA of each one of this plurality of GAM336581 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336581 RNA, herein designated GAM RNA, and which when bound by GAM336581 RNA causes inhibition of translation of the GAM336581 target mRNA into a corresponding GAM336581 target protein.

The mechanism of the translational inhibition exerted by GAM336581 RNA, herein designated GAM RNA, on one or more GAM336581 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336581 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336581 RNA, herein designated GAM RNA, of GAM336581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein
